

S3-Leitlinie Sepsis – Prävention, Diagnose, Therapie und Nachsorge

AWMF-Registernummer: 079 – 001

Evidenzbericht zur Langversion 3.0 – 2018

Deutsche Sepsis Gesellschaft e. V. (federführend)

Unter Mitwirkung von:

Deutsche Gesellschaft für Anästhesiologie und Intensivmedizin e.V. (DGAI)

Deutsche Gesellschaft für Internistische Intensivmedizin und Notfallmedizin (DGIIN)

Deutsche Gesellschaft für Ernährungsmedizin e.V. (DGEM)

Deutsche Gesellschaft für Neurologie (DGN)

Deutsche Gesellschaft für Kardiologie, Herz- und Kreislaufforschung e.V. (DGK)

Deutsche Gesellschaft für Innere Medizin e.V. (DGIM)

Deutsche Gesellschaft für Infektiologie (DGI)

Deutsche Gesellschaft für Nephrologie e.V. (DGfN)

Deutsche Interdisziplinäre Vereinigung für Intensiv- und Notfallmedizin (DIVI)

Deutsche Gesellschaft für Pneumologie und Beatmungsmedizin (DGP)

Deutsche Gesellschaft für Hygiene und Mikrobiologie (DGHM)

Deutsche Sepsis Gesellschaft (DSG)

Deutsche Sepsis Hilfe e. V. (DSH)

Nationales Referenzzentrum für Surveillance von nosokomialen Infektionen (NRZ)

Paul Ehrlich Gesellschaft für Chemotherapie e. V. (PEG)

Methodische Beratung und Begleitung:

Arbeitsgemeinschaft der Wissenschaftlichen Medizinischen Fachgesellschaften e.V. (AWMF)

SUPPLEMENTAL DIGITAL CONTENT 2

CONTENTS

<u>PICO Questions (From Supplemental Digital Content 1)</u>	6
<u>HEMODYNAMICS</u>	31
Table 1. Crystalloid with supplemental Albumin compared to Crystalloids alone for resuscitating patients with sepsis or septic shock	31
Table 2. HES compared to Crystalloids in patients with severe sepsis or septic shock.....	33
Table 3 Gelatin compared to Crystalloids in patients with sepsis or septic shock	35
Table 4 Balanced crystalloids compared to Normal saline in patients with sepsis or septic shock.	37
Table 5. EGDT compared to other protocols or usual care in the acute management of patients with sepsis or septic shock	39
Table 6. Targeted Higher MP (>65 mmHg) compared to Lower MAP (65 mmHg) in Patients with sepsis or septic shock	41
Table 7. Norepinephrine compared to other vasopressors in patients with septic shock.....	43
Figure 1. Norepinephrine and vasopressin compared to Norepinephrine alone in patients with septic shock	45
Table 8 Norepinephrine compared with arginine vasopressin compared to Norepinephrine alone in patients with septic shock	46
Table 9 Vasopressin compared to other vasopressors in patients with septic shock.....	47
Figure 2. Vasopressin compared to other vasopressors in patients with septic shock.....	49
Table 10. Dopamine versus Norepinephrine for the Treatment of Septic Shock	50
Figure 3. Levosimendan versus dobutamine in patients with septic shock and hypoperfusion: Mortality Outcome	51
Table 11. Levosimendan versus dobutamine in patients with septic shock and persistent hypoperfusion.....	52
Table 12. Pulse pressure variation in predicting fluid responsiveness in patients with sepsis or septic shock	53
Table 13. Central venous pressure in predicting fluid responsiveness in patients with sepsis or septic shock	54
Figure 4. Targeted Lactate Clearance in the Management of Patients with Sepsis and Septic Shock: Mortality	55
Table 14. Targeted Lactate Clearance in the Management of Patients with Sepsis and Septic Shock	56
<u>INFECTION</u>	57
Table 15. Performance improvement programs compared to routine care for sepsis.....	57
Table 16. Appropriate initial antibiotics compared to inappropriate initial antibiotics for sepsis ..	58
Table 17. Appropriate antimicrobials compared to inappropriate antimicrobials for sepsis	60
Figure 5. Empiric antifungal coverage in high risk patients with sepsis: mortality outcome.....	61
Table 18. Empiric antifungal compared to culture-directed for sepsis	62
Table 19. Early administration (within 1 hour) of empirically appropriate antimicrobials compared to delay beyond 1 hour for sepsis	63
Table 20. Early administration (within 1 hour) of empirically appropriate antimicrobials compared to delay beyond 1 hour for sepsis	64
Table 21. Monotherapy with a broad-spectrum beta lactam compared to combination therapy for sepsis	65

Table 22. Empiric combination antibiotic therapy compared to monotherapy for critically ill patients at high risk for infection with multi-resistant pathogens, such as Pseudomonas and Acinetobacter	67
Table 23. Double-coverage antibiotic agents compared to monotherapy for septic shock	70
Table 24. Seven days of appropriate antimicrobials compared to greater than seven days of antimicrobials for pyelonephritis and urinary tract infection with sepsis	72
Table 25. 7 or 8 days antibiotics compared to 10 or 15 days antibiotics for ventilator-associated pneumonia.....	73
Table 26. 4 days of antibiotics after source control compared to therapy for 2 days after resolution of symptoms for intra-abdominal infection	75
Table 27. Short course antibiotics (typically 7 or 8 days) compared to longer course (typically 10-15 days) for hospital-acquired pneumonia	77
Figure 6. Procalcitonin versus usual care in determining the duration of antibiotic therapy in patients with infection.....	80
Figure 7. Procalcitonin versus usual care in determining the duration of antibiotic therapy in patients with sepsis	81
Figure 8. Procalcitonin versus usual care: hospital length of stay.....	82
Figure 9. Procalcitonin versus usual care: ICU length of stay.....	83
Figure 10. Procalcitonin versus usual care: Mortality outcome (longest follow-up)	84
Figure 11. Procalcitonin versus usual care: Mortality outcome (at 28 days)	85
Table 28. Procalcitonin-guided de-escalation compared to routine care for guiding antimicrobial dosing in uncertain sepsis.....	86
Figure 12. Impact of early source control on mortality.....	89
Figure 13. Impact of early source control on complications.	90
Figure 14. Impact of early source control on hospital length of stay.....	91
Table 29. Early compared to late cholecystectomy for cholecystitis	92
ADJUNCTIVE THERAPY	94
Figure 15. High dose CRRT versus lower dose : Mortality Outcome	94
Figure 16. High dose CRRT versus lower dose: Reduction in Norepinephrine dose *	95
Figure 17. High dose CRRT versus lower dose : Catecholamine free days outcome	96
Figure 18. High dose CRRT versus lower dose: Renal recovery Outcome	97
Table 30. High dose (>30 ml/kg/hr) CRRT compared to lower dose CRRT in critically ill patients with sepsis and acute kidney injury.....	98
Figure 19. Early RRT versus Late RRT: Mortality Outcome.....	100
Figure 20. Early RRT versus Late RRT: Initiation of RRT	102
Figure 21. Early RRT versus Late RRT: CLABSI Outcome.....	103
Table 31. Early RRT compared to late RRT for acute kidney injury and sepsis.....	104
Figure 22. Effect of Intermittent vs. Continuous RRT on Mortality.....	106
Table 32. Intermittent RRT compared to continuous RRT for sepsis and renal failure.....	107
Figure 23. Blood purification therapy in patients with sepsis: Mortality Outcome	109
Table 33. Blood purification compared to placebo for sepsis.....	110
Figure 24. Hemoperfusion therapy in patients with sepsis: Mortality Outcome.....	112
Table 34. Hemoperfusion compared to usual care for sepsis	113
Figure 25. Hemoperfusion with Polymyxin B in patients with sepsis: Mortality Outcome.....	115
Table 35. Hemoperfusion with Polymyxin B compared to usual care for sepsis	116
Figure 26. Coupled plasma filtration and adsorption in patients with sepsis: Mortality Outcome (at discharge or 30 days).....	117
Figure 27. Coupled plasma filtration and adsorption in patients with sepsis: New organ dysfunction Outcome	118
Table 36. Coupled plasma filtration adsorption compared to usual care for sepsis.....	119
Figure 28. Plasmapheresis In patients with sepsis: Change in APACHE III score.....	121

Table 37. Plasmapheresis compared to usual care for sepsis	122
Figure 29. Plasma exchange in patients with sepsis: Mortality Outcome	123
Table 38. Plasma exchange compared to usual care for sepsis	124
Figure 30. Restrictive transfusion strategy versus liberal transfusion in patients with sepsis: 90-day Mortality Outcome	125
Figure 31. Restrictive transfusion strategy versus liberal transfusion in patients with sepsis: New ischaemic events.....	126
Table 39. Restrictive transfusion strategy (target or trigger 7-7.5 g/dL) compared to permissive strategy (10 g/dL) for sepsis	127
Table 40. Erythropoietin-receptor agonists compared to placebo for sepsis.....	129
Table 41. Antithrombin III compared to placebo for sepsis	130
Table 42. Recombinant thrombomodulin compared to no thrombomodulin, placebo or heparin for sepsis.....	132
Table 43. Heparin compared to placebo or usual care for sepsis	133
Table 44. Steroids compared to placebo for Sepsis	134
<u>MECHANICAL VENTILATION</u>	136
Table 45. Low tidal versus high tidal volume ventilation in mechanically ventilated patients with sepsis	136
Table 46. Targeting plateau pressures in mechanically ventilated patients with sepsis	137
Figure 32. High PEEP versus Low PEEP in mechanically ventilated patients: In-hospital Mortality	138
Table 47. High PEEP versus Low PEEP in mechanically ventilated patients with sepsis	139
Table 48. Recruitment maneuvers in mechanically ventilated patients with sepsis	140
Table 49. Prone ventilation compared to supine ventilation in patients with sepsis	141
Table 50. Head of bed elevation compared to no elevation in mechanically ventilated patients with sepsis	142
Table 51. The use of weaning protocol compared to no protocol in mechanically ventilated patients with sepsis	143
Table 52. The use of SBTs compared to no SBTs in mechanically ventilated patients with sepsis	144
Table 53. The use of PAC compared to no PAC in mechanically ventilated patients with sepsis	145
Figure 33. Conservative versus liberal fluid strategy in mechanically ventilated patients	146
Table 54. Conservative versus liberal fluid strategy in mechanically ventilated patients with sepsis	147
Table 55. Inhaled Beta-agonists compared to placebo in mechanically ventilated patients with sepsis	148
Figure 34. High Frequency Oscillation (HFO) versus no HFO in mechanically ventilated patients with ARDS: Duration of mechanical ventilation Outcome	149
Table 56. High Frequency Oscillation (HFO) versus conventional ventilation in mechanically ventilated patients with ARDS and sepsis	150
Figure 35. Low versus high tidal volumes in mechanically ventilated patients: Mortality Outcome	151
Figure 36. Low versus high tidal volumes in mechanically ventilated patients: Duration of mechanical ventilation Outcome	152
Figure 37. Low versus high tidal volumes in mechanically ventilated patients: Development of ARDS Outcome	153
Table 57. Low versus high tidal volumes in mechanically ventilated patients with sepsis	154
Figure 38. Neuromuscular blocking agents compared to placebo in mechanically ventilated patients with ARDS: Mortality Outcome	155
Figure 39. Neuromuscular blocking agents compared to placebo in mechanically ventilated patients with ARDS: Barotrauma Outcome.....	156

Figure 40. Neuromuscular blocking agents compared to placebo in mechanically ventilated patients with ARDS: ICU acquired weakness Outcome	157
Figure 41. Neuromuscular blocking agents compared to placebo in mechanically ventilated patients with ARDS: Duration of mechanical ventilation Outcome	158
Table 58. Neuromuscular blocking agents compared to usual care/placebo in patients with ARDS and sepsis	159
METABOLIC SECTION	161
Table 59. Stress ulcer prophylaxis compared to no prophylaxis in critically ill patients	161
Table 60. Evidence Profile for proton pump inhibitors versus histamine-2 receptor antagonists.	163
Table 61. Pharmacologic anticoagulation compared to No anticoagulation for VTE prevention..	165
Table 62. LMWH compared to UFH for VTE prevention	167
Table 63. Intermittent pneumatic compression (IPC) compared to No prophylaxis for VTE prevention in patients with sepsis.....	169
Table 64. Graduate compression stockings compared to no prophylaxis for VTE prevention in patients with sepsis or septic shock	171
Figure 42. Early parenteral nutrition versus early enteral nutrition in critically ill patients who can be enterally fed: Mortality Outcome.....	172
Figure 43. Early parenteral nutrition versus early enteral nutrition in critically ill patients who can be enterally fed: Infections Outcome.....	173
Table 65. Early parenteral nutrition compared early enteral nutrition in patients with sepsis.....	174
Figure 44. Early parenteral nutrition versus delayed initiation of nutrition in critically ill patients: Mortality Outcome	176
Figure 45. Early parenteral nutrition versus delayed initiation of nutrition in critically ill patients: Infections Outcome	177
Table 66. Early parenteral nutrition versus delayed initiation of nutrition in critically ill patients with sepsis	178
Figure 46. Trophic feeding versus full feeding in critically ill patients: Mortality Outcome	179
Figure 47. Trophic feeding versus full feeding in critically ill patients: Infections Outcome.....	180
Figure 48. Trophic feeding versus full feeding in critically ill patients: ICU LoS Outcome	181
Table 67. Trophic feeds compared to Full EEN in septic patients	182
Figure 49. Trophic feeds compared to Full EEN in Septic patients: impact on mortality.....	183
Figure 50. Trophic feeds compared to Full EEN in Septic patients: impact on infections.....	184
Table 68. Trophic feeding compared to Delayed nutrition in patients with sepsis or septic shock	185
Figure 51. Omega-3 in critically ill patients with sepsis: Mortality Outcome.....	186
Figure 52. Omega-3 in critically ill patients with sepsis: ICU length of stay Outcome	187
Table 69. Omega-3 versus placebo in patients with sepsis.....	188
Table 70. Not measuring gastric residual volume (GRV) compared to measuring GRV in enterally fed septic patients	189
Figure 53. Small bowel feeding versus gastric feeding in critically ill patients: Mortality Outcome	191
Figure 54. Small bowel feeding versus gastric feeding in critically ill patients: pneumonia Outcome	192
Figure 55. Small bowel feeding versus gastric feeding in critically ill patients: Aspiration Outcome	193
Figure 56. Small bowel feeding versus gastric feeding in critically ill patients: Vomiting Outcome	194
Table 71. Post pyloric feeding compared to Gastric feeding in patients with sepsis.....	195
Figure 57. Prokinetic agents in critically ill patients: Mortality Outcome	197
Figure 58. Prokinetic agents in critically ill patients: Feeding intolerance Outcome	198
Figure 59. Prokinetic agents in critically ill patients: Pneumonia Outcome.....	199

Figure 60. Prokinetic agents in critically ill patients: Successful SB feeding tube placement Outcome	200
Table 72. Prokinetic agents compared to placebo in septic patients who are enterally fed	201
Figure 61. Selenium compared to placebo in septic patients: Mortality Outcome	204
Figure 62. Selenium compared to placebo in septic patients: Mortality Outcome Split by risk of bias of underlying studies.....	205
Figure 63. Selenium compared to placebo in septic patients: Pneumonia Outcome	206
Figure 64. Selenium compared to placebo in septic patients: ICU length of stay Outcome.....	207
Table 73. Selenium supplement compared to no selenium in sepsis or septic shock	208
Table 74. Glutamine compared to No Glutamine in sepsis or septic shock.....	210
Figure 65. Tight glucose control versus conventional control in patients with sepsis: Mortality Outcome	211
Table 75. Tight glucose control (TGC) compared to Conventional glucose control (CGC) in patients with sepsis or septic shock	212
Table 76. Arterial glucose level compared to capillary glucose level for glucose monitoring in patients with sepsis or septic shock on insulin infusion.....	213

PICO QUESTIONS

<i>In patients with sepsis or septic shock, should we use crystalloid with supplemental albumin for initial resuscitation versus crystalloids alone?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Crystalloids and supplemental Albumin	Crystalloids alone	Mortality Renal replacement therapy
<i>In patients with sepsis or septic shock, should we be using HES versus crystalloids for acute resuscitation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	HES	Crystalloids	Mortality Renal replacement therapy
<i>In patients with severe sepsis or septic shock, should we be using gelatin versus crystalloid for acute resuscitation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Gelatins	Crystalloids	Mortality Renal replacement therapy
<i>In patients with sepsis or septic shock, should we use using balanced crystalloid solutions versus normal saline?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis or septic shock	Balanced crystalloid Solutions	Crystalloids	Mortality Renal Replacement Therapy
<i>In patients with sepsis or septic shock, should we recommend using repeated fluid challenge based on hemodynamic variables?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock, that are suspected to be hypovolemic	Repeated fluid challenge as long guided by hemodynamic improvement in dynamic or static variables	Not continue fluid challenges or use alternative criteria	Mortality
<i>In patients with sepsis or septic shock, should we use early goal directed therapy protocol for resuscitation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	EGDT protocol	Other protocols or physician guided therapy	Mortality
<i>In patients with sepsis or septic shock with elevated serum lactate, should we incorporate resuscitation goals aiming to normalize lactate levels?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock and elevated lactate level	Resuscitation targeting normalization of lactate levels	Resuscitation targeting other goals Not including lactate	Mortality
<i>In patients with septic shock requiring vasopressors, should we target mean arterial pressure (MAP) of 65 mmHg vs. higher MAP?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock requiring vasopressors	MAP of 65 mmHg	MAP above 65 mmHg	Mortality
<i>In patients with septic shock requiring vasopressors, should we use norepinephrine versus other agents?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock requiring vasopressors	Norepinephrine	Other vasopressors	Mortality
<i>In patients with septic shock not responding to single vasopressors, should we add epinephrine?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock not responding to single vasopressor	Addition of epinephrine	Other vasopressors	Mortality Arrhythmia
<i>In patients with septic shock requiring vasopressors, should we use norepinephrine alone versus combination with vasopressin?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock requiring vasopressin	Norepinephrine alone	Norepinephrine and Vasopressin	Mortality Renal replacement therapy Arrhythmia Limb ischemia
<i>In patients with septic shock requiring vasopressors, should we use of vasopressin versus other agents?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with septic shock requiring vasopressors	Vasopressin	Other agents	Mortality Renal replacement therapy Arrhythmia Limb ischemia
<i>In patients with septic shock requiring vasopressors, should we use dopamine versus other agents?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock requiring vasopressors	Dopamine	Other agents	Mortality Arrhythmia
<i>In patients with septic shock and persistent hypoperfusion, should we use alternative inotropic agents to increase cardiac output?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock with evidence of persistent hypoperfusion and cardiac dysfunction	levosimendan	Dobutamine	Mortality
<i>In patients with sepsis or septic shock, should we use dynamic parameters (versus static parameters) to predict fluid responsiveness?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Dynamic parameters	Static parameters	Improvement in hemodynamics
<i>Should hospitals use formal resourced performance improvement program for sepsis including sepsis screening for acutely ill, high risk patients?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult acutely ill patients with sepsis	Hospital-based performance programs	No program	Mortality Costs
<i>In patients with sepsis, should we use broad empiric antimicrobial coverage?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis	Antimicrobials with activity against all likely pathogens (broad empiric coverage)	Narrow coverage	Mortality
<i>In patients with septic shock, should we administer empirically appropriate antimicrobials (within one hour of recognition)?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock	Administer empirically appropriate within 1 hour	Administration after 1 hour of recognition	Mortality
<i>In patients with sepsis, should we administer empirically appropriate antimicrobials (within one hour of recognition)?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis	Administer empirically appropriate antimicrobials within 1 hour	Administration after 1 hour of recognition	Mortality
<i>In critically ill septic patients, should we implement pharmacokinetic dosing optimization for each antimicrobial?</i>			
Population	Intervention	Comparator	Outcome(s)

Critically ill adult septic patients	Pharmacokinetic dosing optimization	Standard dosing	Mortality Clinical cure Microbiologic cure
<i>In patients with sepsis and neutropenia, should we use empiric combination antimicrobial therapy versus mono-therapy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis and neutropenia	Combination empiric antimicrobial therapy	Single empiric antimicrobial therapy	Mortality
<i>In patients with sepsis at high risk for multi-drug resistant pathogens, should we use empiric combination antibiotic therapy (versus mono-therapy) until sensitivities are determined?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis caused by difficult-to-treat, multidrug-resistant pathogens, such as <i>Acinetobacter</i> and <i>Pseudomonas</i> spp.	Combination antibiotic therapy	monotherapy	Mortality
<i>In patients with septic shock, should we use empiric double-coverage antibiotic agents until hemodynamic stabilization and pathogen identification?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock	Combination empiric antibiotic therapy with a beta-lactam and an aminoglycoside or fluoroquinolone	Empiric monotherapy	Mortality

<i>In patients with sepsis who are receiving antimicrobials, should we assess for de-escalation of therapy daily?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis who are on antimicrobials	Assess antimicrobials daily for de-escalation	Continue antimicrobial course without daily assessment	Mortality Drug resistance Adverse events
<i>In patients with uncomplicated infections causing sepsis or septic shock, should we recommend a duration of therapy of 7-10 days versus longer course?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Antimicrobial therapy for 7-10 days	Therapy for >10 days	Mortality
<i>In patients with sepsis or septic shock who are receiving empiric combination of antimicrobials should we assess for de-escalation of therapy daily?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock who are on empiric combination of antimicrobials (excluding patients with endocarditis)	De-escalation in 3 to 5 days to the most appropriate single antimicrobial agent as soon as the susceptibility profile is known and/or clinical stability is achieved.	Continue antimicrobial course without daily assessment	Mortality Drug resistance Adverse events
<i>In patients with sepsis, should we use procalcitonin levels to support de-escalation of antimicrobial therapy?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with a diagnosis of sepsis	Use procalcitonin levels or similar biomarkers to assist in empiric antimicrobial discontinuation	Not use biomarkers to assist in empiric antimicrobial discontinuation	Mortality Drug resistance Adverse events
<i>In patients with sepsis or septic shock, should we attempt early (within 12 hours) source control?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock, and remediable source of infection is identified	Source control intervention within first 12 hours	Intervention beyond 12 hours	Mortality
<i>In patients with severe inflammatory state of non-infectious origin should we use systemic prophylactic antimicrobials?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult critically ill patients with severe inflammatory state of non-infectious cause	Prophylactic antimicrobials	No prophylaxis	Mortality
<i>In patients with septic shock, should we use intravenous corticosteroids (versus not)?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with septic shock	Intravenous corticosteroids	Placebo or no intervention	Mortality
<i>In patients with sepsis, should we use plasma filtration therapy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis	Blood purification	No Blood purification	Mortality Vasopressor use

			Organ dysfunction
<i>In patients with sepsis, should we use a hemoperfusion therapy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis	plasma filtration therapy	No plasma filtration therapy	Mortality Vasopressor use Organ dysfunction
<i>In patients with sepsis, should we use a restrictive transfusion strategy versus liberal transfusion?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis	Restrictive blood transfusion threshold (< 7-8 g/dL hemoglobin)	Liberal blood transfusion threshold (9-10 g/dL)	Mortality Amount of blood transfused Myocardial ischemia
<i>In patients with sepsis and anemia, should we use erythropoietin to treat anemia?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis and anemia	erythropoietin	No erythropoietin	Mortality VTE
<i>In non-bleeding patients with sepsis and coagulation abnormalities, should we use prophylactic FFP?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis and laboratory coagulation abnormalities (prolonged PT, PTT), non-bleeding	Fresh frozen plasma	No FFP	Mortality Major bleeding
<i>In non-bleeding patients with sepsis and thrombocytopenia, should we use prophylactic platelet transfusion based on specific platelet levels?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis and thrombocytopenia, non-bleeding	Platelet transfusion for specific threshold (platelet counts \leq 10,000/mm ³ , \leq 20,000/mm ³ if bleeding risk, or \leq 50,000/mm ³ active bleeding, surgery or invasive procedures)	Different platelet transfusion threshold	Mortality Major bleeding
<i>In adult patients with sepsis or septic shock, should we use intravenous immunoglobulins (versus not)?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Intravenous immunoglobulins	Placebo or no intervention	Mortality
<i>In adult patients with sepsis or septic shock, should we antithrombin (versus not)?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis or septic shock	Antithrombin	Placebo or no intervention	Mortality Major bleeding
<i>Should we use stress ulcer prophylaxis in critically ill septic patients?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock and risk factors for stress ulcer	PPIs or H2RA	Placebo or No prophylaxis	Clinically important bleeding Pneumonia C. difficile infection Mortality ICU length of stay
<i>Should we use PPIs (versus H2RA) for stress ulcer prophylaxis in critically ill septic patients?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock and risk factors for stress ulcer	PPIs	H2RA	Clinically important bleeding Pneumonia C. difficile infection Mortality ICU length of stay
<i>Should we use pharmacologic VTE prophylaxis (UFH or LMWH) in critically ill patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult, critically ill patients with sepsis or septic shock	Pharmacologic prophylaxis (UFH or LMWH)	Placebo or No Prophylaxis	Mortality DVT PE Major Bleeding
<i>Should we use LMWH (versus UFH) for VTE prophylaxis in critically ill patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	prophylactic LMWH	prophylactic UFH	Mortality DVT PE Major Bleeding
<i>Should we use mechanical VTE prophylaxis in critically ill patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Mechanical prophylaxis (intermittent compression devices)	No prophylaxis	Mortality DVT PE
<i>Should we use a combination of pharmacologic and mechanical prophylaxis vs. either alone in critically ill patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult, critically ill patients with severe sepsis or septic shock	Pharmacologic prophylaxis (UFH or LMWH) and mechanical prophylaxis	Pharmacologic or mechanical prophylaxis alone	Mortality DVT PE Major Bleeding

<i>Should we use early TPN versus early full enteral feeding in critically ill patients with sepsis or septic shock who can be fed enterally?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock without contraindications for enteral feeding	Early TPN +/- trophic enteral feeding (started ≤48 hrs) in the first 7 days	Early full enteral feeding alone (started ≤48 hrs and to goal ≤72 hrs)	Mortality Infections ICU length of stay
<i>Should we use early TPN versus no or early trophic enteral feeding in critically ill patients with sepsis or septic shock who have contraindications for early full enteral feeding?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock with contraindications for early full enteral feeding	Early TPN +/- trophic enteral feeding in the first 7 days	No or early trophic enteral feeding alone, or enteral feeding according to usual/standard care	Mortality Infections ICU length of stay
<i>Should we use early full enteral feeding versus no initial enteral feeding (except IV glucose/dextrose) in critically ill patients with sepsis or septic shock without contraindications to enteral feeding?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock without contraindications for enteral feeding	Early full enteral feeding	Fasting or intravenous glucose/dextrose with delayed enteral feeding started >48 hours	Mortality Infections ICU length of stay
<i>Should we use early full enteral feeding versus early trophic enteral feeding in patients with sepsis or septic shock without contraindications to enteral feeding?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis or septic shock without contraindications for enteral feeding	Early trophic feeding (trophic $\leq 70\%$ of standard goal)	Early full enteral feeding	Mortality Infections ICU length of stay
<i>Should we use early trophic enteral feeding versus no early enteral feeding (except IV glucose/dextrose) in patients with sepsis or septic shock without contraindications to enteral feeding?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock without contraindications for enteral feeding	Early trophic feeding	Fasting or IV glucose/dextrose with delayed enteral feeding started >48 hrs	Mortality Infections ICU length of stay
<i>Should we use omega-3 supplementation in patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Enteral or parenteral feeding with omega-3 as an immunomodulating supplement	Enteral or parenteral feeding alone	Mortality Infections ICU length of stay
<i>Should we measure gastric residuals when enterally feeding critically ill patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock receiving enteral feeding	Measuring gastric residuals and withholding feeding when residuals exceed a given threshold	No measurement of gastric residuals	Mortality Aspiration pneumonia ICU length of stay
<i>Should we use enteral feeding via a gastric tube versus a post-pyloric tube in patients with sepsis or septic shock?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock receiving enteral feeding	Enteral feeding with a gastric tube	Enteral feeding with a post pyloric feeding tube	Mortality Aspiration or aspiration pneumonia ICU length of stay
<i>Should we use of prokinetic agents for enterally fed patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock who can be enterally fed	Use of pro-kinetic agents (metoclopramide, domperidone, erythromycin)	Placebo; or intervention	Mortality Aspiration or aspiration pneumonia ICU length of stay Successful post pyloric tube placement
<i>Should we use selenium therapy in patients with severe sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Selenium in therapeutic doses	Placebo or No selenium	Mortality Pneumonia ICU length of stay DMV
<i>Should we recommend glutamine therapy in critically ill patients with severe sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis or septic shock	Glutamine in therapeutic doses	Placebo or No glutamine	Mortality ICU LoS DMV
<i>Should we use arginine therapy in patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Arginine in therapeutic doses	Placebo or No arginine	Mortality ICU LoS DMV
<i>Should we use carnitine therapy patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Carnitine in therapeutic doses	Placebo or No carnitine	Mortality ICU LoS DMV
<i>Should we use intensive insulin therapy in patients with sepsis or septic shock?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Intensive insulin therapy	Conventional insulin therapy	Mortality Hypoglycemia
<i>Should we use arterial blood glucose level (versus to point of care resting) in critically ill patients with severe sepsis or septic shock on insulin infusion?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock	Arterial glucose level measurement	Point of care testing	Accuracy of glucose level
<i>In patients with sepsis, should we recommend discussion of goals of cares and prognosis with family?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult, critically ill patients with sepsis or septic shock	Goals of care and prognosis discussed with patients and families	No discussion	Communication and understanding Family satisfaction Stress Anxiety Depression Facilitated decision-making ICU LOS for moribund patients
<i>In patients with sepsis, should we recommend incorporating palliative and end-of-life care?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult, critically ill patients with sepsis or septic shock	Palliative and end-of-life planning incorporated into treatment in ICU	Limited use of palliative or end-of-life care in ICU	Percent of patients receiving a palliative care consult Percent of patients receiving end-of-life care in the ICU

			<p>Withdrawal of life support/DNR rates</p> <p>Family hospital anxiety and depression score</p> <p>Family satisfaction</p> <p>Family member quality of dying score</p> <p>Nurse quality of dying score</p> <p>Health care provider satisfaction score</p> <p>ICU LOS for moribund patients</p>
--	--	--	--

Should we recommend addressing goals of care early (within 72 hours) during ICU stay?

Population	Intervention	Comparator	Outcome(s)
Adult, critically ill patients with sepsis or septic shock	Goals of care addressed within 72 h of admission, as early as feasible	Address goals of care after 72 h	<p>Family care conference held within 72 h of ICU admission</p> <p>Communication and understanding</p> <p>Family satisfaction</p> <p>Facilitated decision-making</p>

			Staff moral distress, staff burnout ICU LOS
<i>In patients with sepsis induced ARDS, should we use low tidal volume ventilation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis induced ARDS	Target Vt of 6 mL/kg PBW	Target Vt of 12 mL/kg PBW	Mortality Duration of mechanical ventilation
<i>In patients with sepsis induced ARDS who are mechanically ventilated, should we use plateau pressures less than 30 cm H2O?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis induced ARDS	Upper limit of plateau pressure: 30 cmH2O	Plateau pressure > 30 cmH2O	Mortality Barotrauma
<i>In patients with sepsis induced ARDS who are mechanically ventilated, should we use high PEEP strategy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced moderate to severe ARDS	“Higher” PEEP	“Lower” PEEP	Mortality
<i>In patients with sepsis induced ARDS, should we use recruitment maneuvers?</i>			
Population	Intervention	Comparator	Outcome(s)

Adult patients with sepsis-induced ARDS and refractory hypoxemia	Recruitment maneuvers	No recruitment maneuvers	Mortality Oxygenation
<i>In patients with sepsis induced severe ARDS, should we use prone ventilation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced severe ARDS	Prone ventilation	No proning	Mortality Oxygenation Complications
<i>In patients with sepsis who are mechanically ventilated, should we elevate the head of the bed?</i>			
Population	Intervention	Comparator	Outcome(s)
Mechanically ventilated adult patients with sepsis	Head of bed between 30 and 45 degrees	No head of bed elevation	Mortality Pneumonia
<i>In patients with sepsis induced ARDS, should we use non-invasive ventilation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS	Noninvasive ventilation (NIV)	Invasive mechanical ventilation	Mortality

<i>In patients with sepsis who are mechanically ventilated and ready for weaning, should we use weaning protocol versus physician guided weaning?</i>			
Population	Intervention	Comparator	Outcome(s)
Mechanically ventilated adult patients with sepsis who are can tolerate weaning from mechanical ventilation	Weaning protocol	No protocol	Mortality Successful extubation Duration of mechanical ventilation
<i>In patients with sepsis who are mechanically ventilated and ready for weaning, should we use spontaneous breathing trials (SBT)?</i>			
Population	Intervention	Comparator	Outcome(s)
Mechanically ventilated adult patients with sepsis who are can tolerate weaning from mechanical ventilation	Regular SBT	No SBT	Mortality Successful extubation Duration of mechanical ventilation
<i>In patients with sepsis induced ARDS, should we use pulmonary artery catheter (PAC)?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS	Use of PAC	No PAC	Mortality Duration of mechanical ventilation

<i>In patients with sepsis induced ARDS, should we use conservative fluid strategy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS, and no signs of tissue hypoperfusion	“Conservative” fluid strategy	“Liberal” fluid strategy	Mortality Duration of mechanical ventilation ICU length of stay
<i>In patients with sepsis induced ARDS, should we use inhaled Beta agonists?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS and no bronchospasm	Use of inhaled Beta agonists	No Beta agonists or placebo	Mortality Duration of mechanical ventilation
<i>In patients with sepsis induced ARDS, should we use ECMO treatment?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS	ECMO/expert therapy	Usual Care	Mortality Duration of mechanical ventilation
<i>In patients with sepsis induced ARDS, should we use High Frequency Oscillation (HFO) versus conventional ventilation?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced ARDS	HFO ventilation	Conventional Mechanical Ventilation	Mortality Duration of mechanical ventilation
<i>In patients with sepsis induced respiratory failure without ARDS, should we use low tidal volume ventilation?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis-induced respiratory failure	Low tidal volume ventilation	Conventional Mechanical Ventilation	Mortality Duration of mechanical ventilation Development of ARDS
<i>In mechanically ventilated patients with sepsis, should we use sedation targets?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult mechanically ventilated patients with sepsis	Sedation targets “specific endpoints”	No targets used to guide sedation	Mortality Duration of mechanical ventilation ICU length of stay
<i>In patients with severe ARDS who are mechanically ventilated, should we use neuromuscular blocking agents?</i>			

Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis induced ARDS	Neuromuscular blocking agent	Placebo	Mortality Ventilator-free days ICU-acquired weakness Barotrauma
<i>In patients with sepsis and indication for hemodialysis, should we use CRRT versus intermittent hemodialysis?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis and acute kidney injury requiring dialysis	CRRT	IHD	Mortality
<i>In patients with sepsis and AKI with no indication for hemodialysis, should we use renal replacement therapy versus not?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis and acute kidney injury without indication for hemodialysis	Renal replacement therapy (early initiation of renal replacement therapy)	No dialysis	Mortality
<i>In patients with sepsis or septic shock and hypoperfusion-induced lactic acidosis, should we use sodium bicarbonate therapy?</i>			
Population	Intervention	Comparator	Outcome(s)
Adult patients with sepsis or septic shock and hypoperfusion-induced lactic acidosis	Intravenous sodium bicarbonate	Placebo or no intervention	Mortality

HES: Hydroxyethyl starches; EGDT: Early goal directed therapy; MAP: Mean arterial pressure; PT: prothrombin time; PTT: Partial thromboplastin time; FFP: Fresh frozen plasma; PPI: Proton pump inhibitor; H2RA: Histamine 2 receptor antagonist; UFH: Unfractionated heparin; LMWH: Low molecular weight heparin; TPN: Total parenteral nutrition; ICU: Intensive care unit; DMV: Duration of mechanical

ventilation; LOS: length of stay; DNR: Do not resuscitate; Vt: Tidal volume; PBW: Per body weight; PEEP: Peak end expiratory pressure; SBT: Spontaneous breathing trial; PAC: Pulmonary arterial catheter; ECMO: Extra-corporeal membrane oxygenation; HFO: High frequency oscillation; CRRT: Continuous renal replacement therapy

HEMODYNAMICS

Table 1. Crystalloid with supplemental Albumin compared to Crystalloids alone for resuscitating patients with sepsis or septic shock

Author(s): Alhazzani W, Osborne T, Antonelli M

Question: Crystalloid with supplemental Albumin compared to Crystalloids alone for resuscitating patients with sepsis or septic shock

Setting: ICU

Bibliography: Caironi P, Tognoni G, Masson S, Fumagalli R, Pesenti A, Romero M et al. Albumin replacement in patients with severe sepsis or septic shock. N Engl J Med. 2014;370(15):1412-21. doi:10.1056/NEJMoa1305727.

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Crystalloid with supplemental Albumin	Crystalloids alone	Relative (95% CI)	Absolute (95% CI)		
28 days Mortality in all patients												
1	randomized trials	not serious	not serious	serious ¹	not serious ²	none	285/895 (31.8%)	288/900 (32.0%)	RR 1.00 (0.87 to 1.14)	0 fewer per 1,000 (from 42 fewer to 45 more)	⊕⊕⊕○ MODERATE	CRITICAL
90 days Mortality (all patients)												
1	randomized trials	not serious	not serious	serious ¹	not serious	none	365/888 (41.1%)	389/893 (43.6%)	RR 0.94 (0.85 to 1.05)	26 fewer per 1,000 (from 22 more to 65 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
90 days Mortality (subgroup with septic shock)												

1	randomized trials	not serious ³	not serious	serious ¹	serious ⁴	none	243/557 (43.6%)	281/564 (49.8%)	RR 0.87 (0.77 to 0.99)	65 fewer per 1,000 (from 5 fewer to 115 fewer)	⊕⊕○○ LOW	CRITICAL
Renal Replacement Therapy												
1	randomized trials	not serious	not serious	serious ¹	serious ⁵	none	222/903 (24.6%)	194/907 (21.4%)	RR 1.15 (0.97 to 1.36)	32 more per 1,000 (from 6 fewer to 77 more)	⊕⊕○○ LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. We downgraded the quality of evidence for indirectness by one level, the administration of albumin in the intervention group was after the first 6 hours, as early goal directed therapy was implemented for all patients, therefore, we considered this as indirectness in the intervention
2. Although the confidence interval includes 13% relative risk reduction, and 14% relative risk increase in mortality, we decided not to downgrade for imprecision because the CI was narrow and point estimate was 1
3. Although this was a post hoc subgroup analysis, we decided not to downgrade the quality of evidence for risk of bias because randomization was stratified by presence of shock
4. We downgraded for imprecision by one level, the upper limit of the CI was 0.99 which include negligible benefit
5. We downgraded the quality of evidence by one level for imprecision, the CI contains significant benefit and harm

Table 2. HES compared to Crystalloids in patients with severe sepsis or septic shock

Author(s): Perner A, Alhazzani W

Date: December 2 2015

Question: HES compared to Crystalloids in patients with severe sepsis or septic shock

Setting: Intensive Care Unit (ICU)

Bibliography: Haase N, Perner A, Hennings LI, Siegemund M, Lauridsen B, Wetterslev M, Wetterslev J. Hydroxyethyl starch 130/0.38-0.45 versus crystalloid or albumin in patients with sepsis: systematic review with meta-analysis and trial sequential analysis. BMJ. 2013 Feb 15;346:f839.

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	HES ¹	Crystalloids	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: Long-term follow-up, >28 days)												
4	randomized trials	not serious	not serious	not serious	not serious ²	none	533/1591 (33.5%)	478/1565 (30.5%)	RR 1.11 (1.01 to 1.22)	34 more per 1000 (from 3 more to 67 more)	⊕⊕⊕⊕ HIGH	CRITICAL
Renal Replacement Therapy												
5	randomized trials ³	not serious	not serious	not serious	not serious	none	136/650 (20.9%)	101/661 (15.3%)	RR 1.36 (1.08 to 1.72)	55 more per 1000 (from 12 more to 110 more)	⊕⊕⊕⊕ HIGH	CRITICAL
Serious Adverse Events												

4	randomized trials	not serious	not serious	not serious	not serious ¹	none	100/533 (18.8%)	76/536 (14.2%)	RR 1.30 (1.03 to 1.67)	43 more per 1000 (from 4 more to 95 more)	⊕⊕⊕⊕ HIGH	IMPORTANT
---	-------------------	-------------	-------------	-------------	--------------------------	------	-----------------	----------------	-------------------------------	--	--------------	-----------

MD: mean difference; RR: relative risk; HES – Hydroxyethyl starch; CI: confidence interval

1. HES 130/0.38-0.45
2. Although the lower limit of confidence interval was close to 1, we did not downgrade for imprecision because the signal for harm is consistent with other outcomes and even small increase in harm is considered significant
3. In one study (Dolecek 2009) albumin 20% was used as a comparison, but there were no RRT events

Table 3. Gelatin compared to Crystalloids in patients with sepsis or septic shock

Author(s): Rochweg B, Alhazzani W

Question: Gelatin compared to Crystalloids in patients with sepsis or septic shock

Setting: Intensive Care Unit (ICU)

Bibliography: Moeller C, Fleischmann C, Thomas-Rueddel D, Vlasakov V, Rochweg B, Theurer P, et al. How safe is gelatin? A systematic review and meta-analysis of gelatin-containing plasma expanders vs crystalloids and albumin. J Crit Care. 2016;35:75-83.

No of studies	Study design	Quality assessment					No of patients		Effect		Quality	Importance
		Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	gelatin	other fluid	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: Longest available)												
6	randomized trials	not serious ¹	not serious	serious ²	serious ³	none	95/556 (17.1%)	97/595 (16.3%)	RR 1.10 (0.85 to 1.43)	16 more per 1000 (from 24 fewer to 70 more)	⊕⊕○○ LOW	CRITICAL
Acute Kidney Injury (assessed with: Urea > 30mmol/L, need for RRT, Cr increase by 2.0 mg/dL or Cr > 1.5 mg/dL)												
3	randomized trials	serious ⁴	not serious	very serious ⁵	very serious ⁶	none	14/108 (13.0%)	10/104 (9.6%)	RR 1.35 (0.58 to 3.14)	34 more per 1000 (from 40 fewer to 206 more)	⊕○○○ VERY LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. Lack of blinding in two of included trials although not lowered for mortality outcome.
2. We downgraded the quality of evidence by one level for imprecision. One trial (Upadhyay) was in children with sepsis. Another (Parker) was in critically ill postoperative patients. The intervention and comparator fluid regimes varied across included studies.
3. We downgraded the quality of evidence by one level for imprecision. Confidence intervals fail to exclude harm or benefit.
4. We downgraded the quality of evidence by one level for risk of bias due to lack of blinding in 2 out of 3 included studies.

5. We downgraded the quality of evidence by two levels for indirectness in population and intervention. One trial (Soares) was in post cardiac surgery patients, another (Upadhyay) was in children with sepsis. Trials used varying fluid regimes and comparators. The definition of AKI varied per trial. AKI is a surrogate outcome for dialysis need and death.
6. We downgraded the quality of evidence by one level for imprecision due to wide confidence intervals do not exclude benefit or harm. Very small number of events make overall results very uncertain.

Table 4. Balanced crystalloids compared to Normal saline in patients with sepsis or septic shock

Author(s): Alhazzani W, Perner A

Date: December 2 2015

Question: Balanced crystalloids compared to Normal saline in in patients with sepsis or septic shock

Setting: ICU

Bibliography: Rochweg B, Alhazzani W, Sindi A, Heels-Ansdell D, Thabane L, Fox-Robichaud A et al. Fluid resuscitation in sepsis: a systematic review and network meta-analysis. *Ann Intern Med.* 2014;161(5):347-55. doi:10.7326/M14-0178.

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Balanced crystalloids	Normal saline	Relative (95% CI)	Absolute (95% CI)		
Mortality												
N/A	randomized trials ¹	not serious	not serious	Very serious ²	serious ³	none	N/A	25.0%	RR 0.78 (0.58 to 1.05)	55 fewer per 1000 (from 13 more to 105 fewer)	⊕○○○ VERY LOW	CRITICAL
Renal Replacement Therapy												
N/A	randomized trials ¹	not serious	not serious ⁴	Very serious ²	serious ⁵	none	N/A	23.0% ⁶	RR 0.85 (0.56 to 1.30)	35 fewer per 1000 (from 69 more to 101 fewer)	⊕○○○ VERY LOW	CRITICAL
								51.0% ⁶		77 fewer per 1000 (from 153 more to 224 fewer)		

MD – mean difference, RR – relative risk

1. There are no head to head RCTs on this question, we used the estimates from network meta-analysis (indirect comparison)
2. We downgraded by two levels for indirectness, we used data from indirect comparison only, no direct comparison studies are available
3. We downgraded the quality of evidence by one level for imprecision, the CI includes significant benefit and small harm.
4. We could not assess inconsistency as all the evidence is derived from indirect comparisons
5. We downgraded the quality of evidence by one level for imprecision, the CI contained both significant benefit and harm
6. Data from Rangel-Frausto et al.

Table 5. EGDT compared to other protocols or usual care in the acute management of patients with sepsis or septic shock

Author(s): Alhazzani W

Date: December 4, 2015

Question: EGDT compared to other protocols or Usual care in the acute management of patients with sepsis or septic shock

Setting: ICU

Bibliography: Angus DC, Barnato AE, Bell D, Bellomo R, Chong CR, Coats TJ et al. A systematic review and meta-analysis of early goal-directed therapy for septic shock: the ARISE, ProCESS and ProMISe Investigators. Intensive Care Med. 2015;41(9):1549-60. doi:10.1007/s00134-015-3822-1.

Mortality												
2	randomized trials	not serious	not serious	not serious	serious ¹	none ²	184/411 (44.8%)	202/399 (50.6%)	RR 0.89 (0.77 to 1.02)	56 fewer per 1000 (from 10 more to 116 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
								40.0% ³		44 fewer per 1000 (from 8 more to 92 fewer)		

CI: Confidence interval; **RR:** Risk ratio

1. We downgraded the quality of evidence by one level for imprecision, the CI crossed the line of no difference
2. We could not reliably assess for publication bias due to small number of studies, we conducted a comprehensive literature search therefore we considered the possibility of publication bias to be very small
3. Data from Sepsis-3

Table 9. Vasopressin compared to other vasopressors in patients with septic shock

Author(s): Alshamsi F, Alhazzani W, Singer M

Date: October 7 2016

Question: Vasopressin compared to other pressors in patients with septic shock

Setting: ICU

Bibliography: Avni T, Lador A, Lev S, Leibovici L, Paul M, Grossman A. Vasopressors for the treatment of septic shock: systematic review and meta-analysis. PloS one. 2015 Aug 3;10(8):e0129305.

No of studies	Study design	Risk of bias	Quality assessment				No of patients		Effect		Quality	Importance
			Inconsistency	Indirectness	Imprecision	Other considerations	Vasopressin	other pressors	Relative (95% CI)	Absolute (95% CI)		
Mortality												
9	randomized trials	not serious	not serious	not serious ¹	serious ²	none ³	273/674 (40.5%)	293/650 (45.1%)	RR 0.89 (0.79 to 1.00)	50 fewer per 1,000 (from 0 fewer to 95 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
							40.0% ⁴	44 fewer per 1,000 (from 0 fewer to 84 fewer)				

CI: Confidence interval; RR: Risk ratio

1. Although there was some indirectness at the intervention level, majority of trials used a combination of AVP or terlipressin with norepinephrine in the intervention arm, however, a sensitivity analysis excluding these studies did not significantly affect the quality of evidence or direction of treatment effect, therefore, we did not downgrade for indirectness

2. The CI interval included significant benefit and crossed the unity line, therefore, we downgraded the quality of evidence for imprecision by one level
3. We could not reliably assess for publication bias due to small number of included studies
4. Data on septic shock mortality from Sepsis-3

Figure 2. Vasopressin compared to other vasopressors in patients with septic shock

Mortality Outcome (9 RCTs 1234 patients)

Study or Subgroup	Vasopressin/Terlipressin		Other vasopressors		Weight	Risk Ratio		Year
	Events	Total	Events	Total		IV, Random, 95% CI

Mortality												
6	randomized trials	serious ¹	not serious ²	not serious	serious ³	none	53/112 (47.3%)	63/108 (58.3%)	RR 0.83 (0.66 to 1.05)	99 fewer per 1000 (from 29 more to 198 fewer)	⊕⊕○○ LOW	CRITICAL

CI: Confidence interval; **RR:** Risk ratio

1. We downgraded for risk of bias by one level, the randomization process and allocation concealment was unclear for most trials. small sample size, blindness and allocation concealment not adequately described
2. The $I^2 = 0\%$, no significant statistical heterogeneity identified
3. We downgraded the quality of evidence for imprecision by one level, the CI contained significant benefit and small harm

Table 12. Pulse pressure variation in predicting fluid responsiveness in patients with sepsis or septic shock

Sensitivity	0.72 (95% CI: 0.61 to 0.81)									
Specificity	0.91 (95% CI: 0.83 to 0.95)									
			Prevalence		40% ⁵					
Outcome	No of studies (No of patients)	Study design	Factors that may decrease quality of evidence					Effect per 1,000 patients tested	Test accuracy QoE	
			Risk of bias	Indirectness	Inconsistency	Imprecision	Publication bias			
True positives (patients with Fluid responsiveness)	5 studies 219 patients	cross-sectional (cohort type accuracy study)	serious ¹	not serious	not serious	serious ²	none	288 (244 to 324)	⊕⊕○○ LOW	
False negatives (patients incorrectly classified as not having Fluid responsiveness)								112 (76 to 156)		
True negatives (patients without Fluid responsiveness)	5 studies 219 patients	cross-sectional (cohort type accuracy study)	serious ¹	not serious ³	not serious	serious ⁴	none	546 (498 to 570)	⊕⊕○○ LOW	
False positives (patients incorrectly classified as having Fluid responsiveness)								54 (30 to 102)		

1. We downgraded the quality of evidence for risk of bias by one level, most studies were at high risk of bias with QUADAS Tool
2. We downgraded the quality for imprecision by one level, 112 per 1000 tested patients will have a false negative results, the CI of pooled sensitivity was wide
3. Although the reference test was not a static measure in included studies, we did not downgrade the quality of evidence because we can indirectly compare with other static measures
4. We downgraded the quality of evidence by one level for imprecision, small number of patients and the CI of the pooled specificity included values below the desired threshold
5. Prevalence of fluid responsiveness is estimated to be 40%, data from Bentzer P, Griesdale DE, Boyd J, MacLean K, Sirounis D, Ayas NT. Will This Hemodynamically Unstable Patient Respond to a Bolus of Intravenous Fluids? JAMA. 2016;316(12):1298-309.

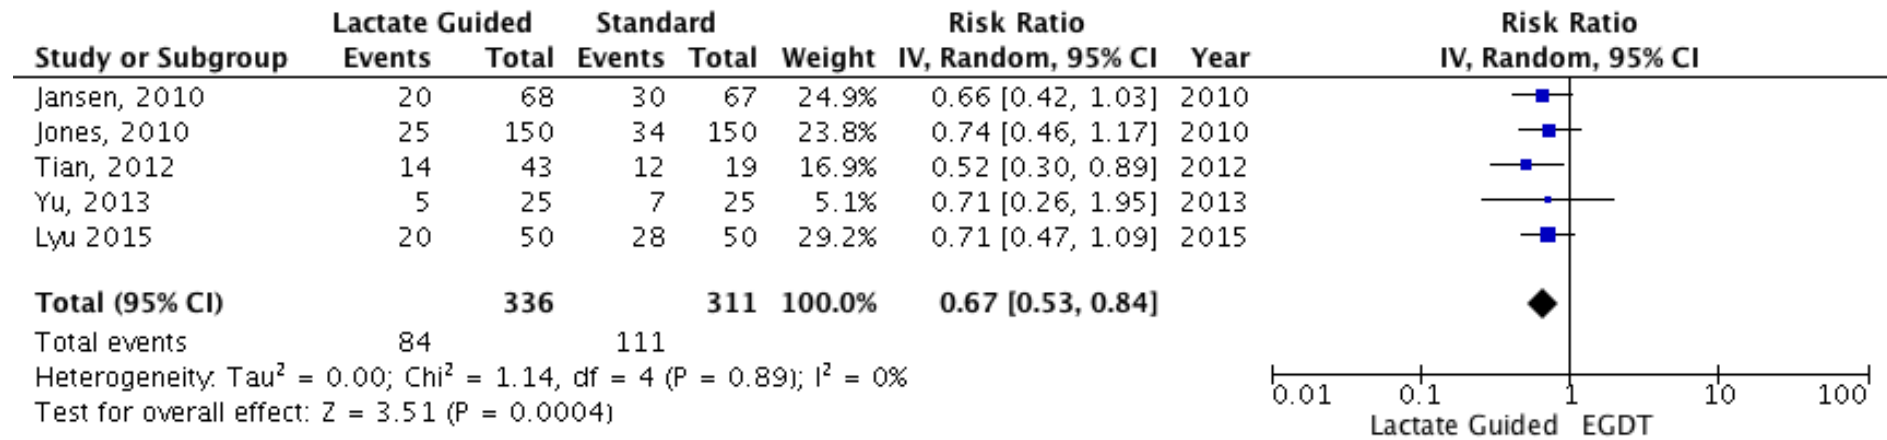

Table 13. Central venous pressure in predicting fluid responsiveness in patients with sepsis or septic shock

Sensitivity	0.62 (95% CI: 0.54 to 0.69)	Prevalence 40%	
Specificity	0.76 (95% CI: 0.60 to 0.87)		

Outcome	No of studies (No of patients)	Study design	Factors that may decrease quality of evidence					Effect per 1,000 patients tested pre-test probability of 40%	Test accuracy QoE
			Risk of bias	Indirectness	Inconsistency	Imprecision	Publication bias		
True positives (patients with fluid responsiveness)	7 studies 356 patients	cross-sectional (cohort type accuracy study)	serious ¹	not serious	not serious	serious ²	none	248 (216 to 276)	⊕⊕○○ LOW
False negatives (patients incorrectly classified as not having fluid responsiveness)								152 (124 to 184)	
True negatives (patients without fluid responsiveness)	7 studies 356 patients	cross-sectional (cohort type accuracy study)	serious ¹	not serious	not serious	serious ³	none ⁴	456 (360 to 522)	⊕⊕○○ LOW
False positives (patients incorrectly classified as having fluid responsiveness)								144 (78 to 240)	

1. We downgraded the quality of evidence for risk of bias by one level, the risk of bias was high in most studies as judged by review authors
2. We downgraded the quality of evidence for imprecision by one level, the CI around false negatives is wide, and the total number of participant is small
3. We downgraded the quality of evidence for imprecision by one level, the CI around specificity is wide
4. No report on publication bias was provided in the manuscript, we couldn't assess this category
5. The prevalence of fluid responsiveness is assumed to be 40%, data from Bentzer P, Griesdale DE, Boyd J, MacLean K, Sirounis D, Ayas NT. Will This Hemodynamically Unstable Patient Respond to a Bolus of Intravenous Fluids? JAMA. 2016;316(12):1298-309.

Figure 4. Targeted Lactate Clearance in the Management of Patients with Sepsis and Septic Shock: Mortality

CI: confidence interval; IV: inverse variance

Table 14. Targeted Lactate Clearance in the Management of Patients with Sepsis and Septic Shock

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	resuscitation targeting lactate clearance	other strategies	Relative (95% CI)	Absolute (95% CI)		
Hospital Mortality												
5	randomized trials	serious ¹	not serious	not serious	serious ²	none	84/336 (25.0%)	111/311 (35.7%)	RR 0.67 (0.53 to 0.84)	118 fewer per 1,000 (from 57 fewer to 168 fewer)	⊕⊕○○ LOW	CRITICAL
								40.0% ³		132 fewer per 1,000 (from 64 fewer to 188 fewer)		
ICU LoS												
3	randomized trials	not serious	serious ⁴	not serious	serious ⁵	none	194	196	-	MD 1.51 days lower (3.65 lower to 0.62 higher)	⊕⊕○○ LOW	IMPORTANT

CI: Confidence interval; RR: Risk ratio; MD: Mean difference

1. All studies were judged to be at high risk of bias due to lack of clarity of the intervention, therefore, we downgraded the quality of evidence by one level for risk of bias
2. We downgraded the quality of evidence by one level for imprecision, the CI contained small benefit that was lower than the decision threshold
3. We assumed a mortality rate for patients with septic shock to be 40%
4. We downgraded for inconsistency by one level, I²= 64%
5. We downgraded the quality of evidence for imprecision by one level, the CI contained significant benefit and harm

11	randomized trials	not serious ¹	not serious	serious ⁵	not serious	none	49/825 (5.9%)	70/893 (7.8%)	RR 0.74 (0.53 to 1.06)	20 fewer per 1000 (from 5 more to 37 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
All-cause mortality, febrile neutropenic cancer patients, different beta-lactam in both groups. Paul meta-analysis for neutropenic patients												
33	randomized trials	not serious ¹	not serious	serious ⁵	not serious	none	217/2849 (7.6%)	221/2619 (8.4%)	RR 0.91 (0.77 to 1.09)	8 fewer per 1000 (from 8 more to 19 fewer)	⊕⊕⊕○ MODERATE	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. Although no blinding in most studies, no downgrade as we were assessing mortality.
2. We downgraded the quality of evidence by one level for imprecision, the 95% CI range from 27% improved survival to 30% higher risk of death with monotherapy.
3. Funnel plot asymmetrical pointing out missing studies (unpublished or published but not reporting on mortality) favoring combination therapy.
4. We downgraded the quality of evidence by one level for risk of bias, advantage of monotherapy accentuated in studies with unclear allocation concealment and per-protocol analysis.
5. We downgraded the quality of evidence for indirectness of population by one level. Patients febrile, not necessarily septic.

Table 22. Empiric combination antibiotic therapy compared to monotherapy for critically ill patients at high risk for infection with multi-resistant pathogens, such as Pseudomonas and Acinetobacter

Author(s): Mark E. Nunnally

Date: 2 March 2016

Question: Empiric combination antibiotic therapy compared to monotherapy for critically ill patients at high risk for infection with multi-resistant pathogens, such as Pseudomonas and Acinetobacter

Setting: Intensive care unit

CI: Confidence interval; RR: Risk ratio; MD: Mean difference; ICU: Intensive care unit

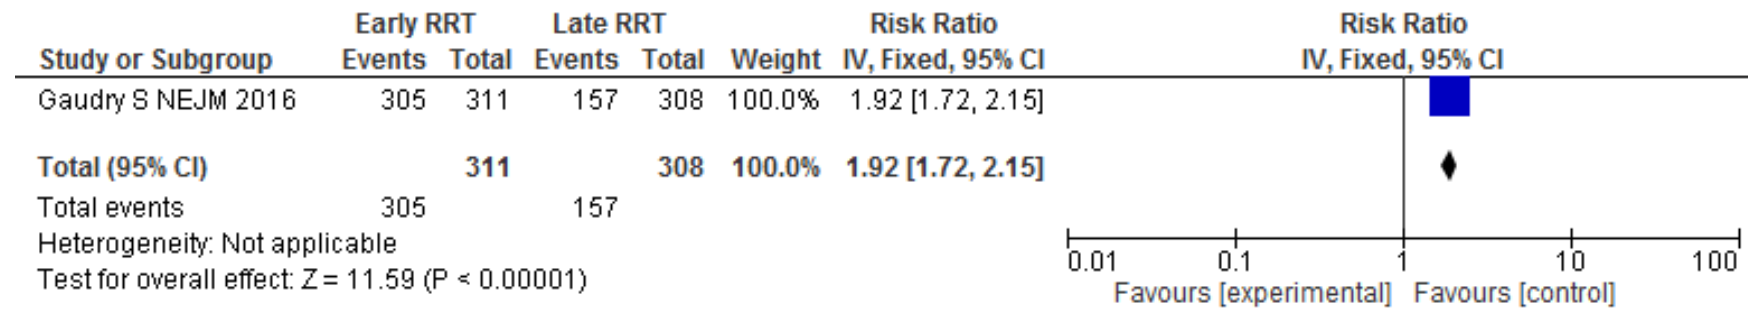

1. We downgraded the quality of evidence for risk of bias by one level, there was no blinding of caregivers, uncertain blinding of outcome assessment. At least 5 contributing studies were post hoc assessments.
2. We downgraded the quality of evidence by one level for imprecision, the 95 % CI embrace harm and benefit.
3. Imbalances in baseline data, primary and secondary outcomes not defined for 1 study (Morgera 2004).
4. $I^2 = 41\%$. Visual inspection of Forest plot suggests significant heterogeneity.
5. Post hoc analysis of unpublished data. Significant imbalances between groups.
6. Wide CI embracing harm and benefit. 9 total events.
7. $I^2 = 74\%$. visual inspection of Forest plot suggests significant heterogeneity.

9	randomized trials	not serious	serious ¹	very serious ²	not serious	none	116/323 (35.9%)	138/279 (49.5%)	RR 0.61 (0.43 to 0.86)	193 fewer per 1,000 (from 69 fewer to 282 fewer)	⊕○○○ VERY LOW	CRITICAL

CI: Confidence interval; **RR:** Risk ratio

1. We downgraded the quality of evidence by one level for inconsistency, the $I^2 = 63\%$
2. We downgraded the quality of evidence by two levels for indirectness of population, the analysis included small studies, mostly from Japan.

Figure 26. Coupled plasma filtration and adsorption in patients with sepsis: Mortality Outcome (at discharge or 30 days)

Experimental: coupled plasma filtration and adsorption; **IV:** inverse variance

Figure 27. Coupled plasma filtration and adsorption in patients with sepsis: New organ dysfunction Outcome

Experimental: coupled plasma filtration and adsorption; **IV:** inverse variance

Table 36. Coupled plasma filtration adsorption compared to usual care for sepsis

Author(s): Paolo Navalesi, Mark E. Nunnally

Date: 18 July 2016

Question: Coupled plasma filtration adsorption compared to placebo for sepsis

Setting: Intensive care unit

No of studies	Study design	Risk of bias	Quality assessment				No of patients		Effect		Quality	Importance
			Inconsistency	Indirectness	Imprecision	Other considerations	Coupled plasma filtration adsorption	placebo	Relative (95% CI)	Absolute (95% CI)		
Mortality- discharge or 30 days												
2	randomized trials	not serious ¹	serious ²	not serious	very serious ³	none	46/102 (45.1%)	54/105 (51.4%)	RR 0.79 (0.47 to 1.32)	108 fewer per 1,000 (from 165 more to 273 fewer)	⊕○○○ VERY LOW	CRITICAL
New Organ Dysfunction												
1	randomized trials	not serious ⁴	not serious	not serious	very serious ⁵	none	51/91 (56.0%)	52/93 (55.9%)	OR 1.01 (0.56 to 1.80)	2 more per 1,000 (from 136 more to 144 fewer)	⊕⊕○○ LOW	IMPORTANT

CI: Confidence interval; **RR:** Risk ratio; **OR:** Odds ratio; **MD:** Mean difference

- Both studies unclear risk of bias. No downgrade because the outcome is less prone to bias.

2. We downgraded the quality of evidence by one level for inconsistency, the $I^2 = 51\%$
3. We downgraded the quality of evidence by two levels for imprecision, the 95% CI embraces 1 and the number of events is small (100 total events)
4. Although risk of bias unclear, we elected not to downgrade for risk of bias as we downgraded for other categories
5. We downgraded the quality of evidence by two levels for imprecision, the 95% CI embraces 1 and the number of events is small (103 total events)

Figure 28. Plasmapheresis In patients with sepsis: Change in APACHE III score

Experimental: Plasmapheresis; **IV:** Inverse variance

Table 37. Plasmapheresis compared to usual care for sepsis

Author(s): Paolo Navalesi, Mark E. Nunnally

Date: 18 July 2016

Question: Plasmapheresis compared to placebo for sepsis

Setting: Intensive care unit

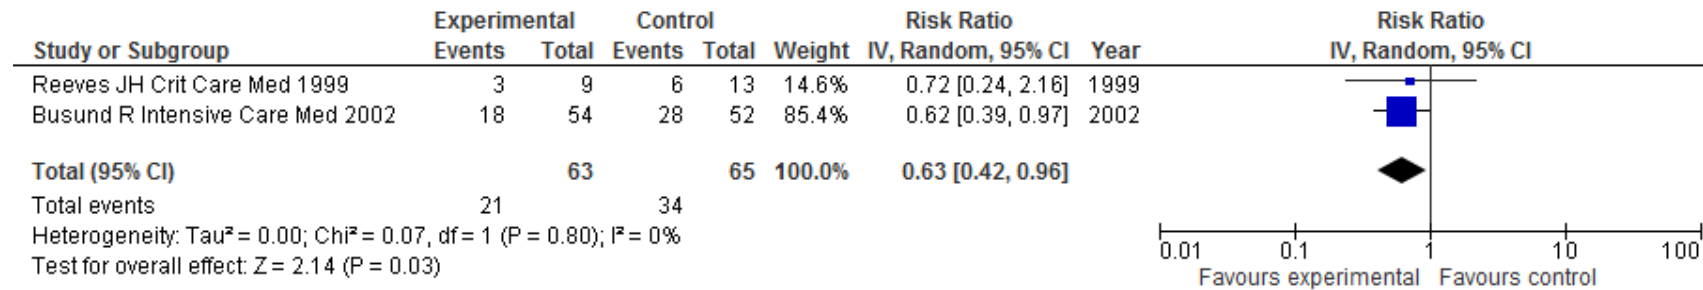

Bibliography:

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Plasmapheresis	placebo	Relative (95% CI)	Absolute (95% CI)		
Change in APACHE III from day 1 to day 2												
1	randomized trials	serious ¹	not serious	not serious	very serious ²	none	64	52	-	MD 7 lower (12.73 lower to 1.27 lower)	⊕○○○ ○ VERY LOW	IMPORTANT

CI: Confidence interval; **MD:** Mean difference

1. Selective reporting plausible. Only change in APACHE reported
2. We downgraded the quality of evidence by two levels for imprecision, the sample size is small (116 patients), and the 95% CI embraces effect of questionable significance.

Figure 29. Plasma exchange in patients with sepsis: Mortality Outcome

Experimental: Plasma exchange; **IV:** Inverse variance

Table 38. Plasma exchange compared to usual care for sepsis

CI: Confidence interval; RR: Risk ratio

1. We downgraded the quality of evidence by two levels for imprecision, small number of events (55 total events)

Figure 30. Restrictive transfusion strategy versus liberal transfusion in patients with sepsis: 90-day Mortality Outcome

Experimental: Restrictive transfusion strategy; **Control:** Liberal transfusion strategy; **IV:** inverse variance

Figure 31. Restrictive transfusion strategy versus liberal transfusion in patients with sepsis: New ischaemic events

Experimental: Restrictive transfusion strategy; **Control:** Liberal transfusion strategy; **IV:** inverse variance

Table 39. Restrictive transfusion strategy (target or trigger 7-7.5 g/dL) compared to permissive strategy (10 g/dL) for sepsis

Setting: Intensive care unit

Author(s): Janice Zimmerman, Mark E. Nunnally

Question: Restrictive transfusion strategy (target or trigger 7-7.5 g/dL) compared to permissive strategy (10 g/dL) for sepsis

Setting: Intensive care unit

Bibliography: 1. ProCESS Investigators. A randomized trial of protocol-based care for early septic shock. *New Eng J Med* 2014;370:1683-93 2. Holst LJ, Haase N, Wetterslev J, et al. Lower versus higher hemoglobin threshold for transfusion in septic shock. *New Eng J Med* 2014;371(15):1381-91

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	restrictive transfusion strategy (target or trigger 7-7.5 g/dL)	permissive strategy (10 g/dL)	Relative (95% CI)	Absolute (95% CI)		
90 d Mortality (TRISS only) (follow up: 90 days)												
1	randomized trials	not serious	not serious	not serious	not serious	none	216/502 (43.0%)	223/496 (45.0%)	RR 0.94 (0.78 to 1.09)	27 fewer per 1000 (from 40 more to 99 fewer)	⊕⊕⊕⊕ HIGH	CRITICAL
Mortality (at 90 days)												
2	randomized trials ¹	not serious	not serious	not serious	not serious	none	344/917 (37.5%)	352/901 (39.1%)	RR 0.96 (0.86 to 1.08)	16 fewer per 1000 (from 31 more to 55 fewer)	⊕⊕⊕⊕ HIGH	CRITICAL

Ischemic events												
1	randomized trials	not serious	not serious	not serious	not serious	none	35/488 (7.2%)	39/489 (8.0%)	RR 0.90 (0.58 to 1.39)	8 fewer per 1000 (from 31 more to 33 fewer)	⊕⊕⊕⊕ HIGH	CRITICAL

CI: Confidence interval; **RR:** Risk ratio

1. ProCESS randomized by resuscitation protocol, which included different transfusion goals. This, however, was part of a more complex intervention. Hemoglobin goal 7.5 versus 10 g/dL.

Table 40. Erythropoietin-receptor agonists compared to placebo for sepsis

Author(s): Mark E. Nunnally

Date: 18 July 2016

Question: Erythropoietin-receptor agonists compared to placebo for sepsis

Setting: intensive care units

Bibliography: Zarychanski R, Turgeon AF, McIntyre L, Fergusson DA. Erythropoietin-receptor agonists in critically ill patients: a meta-analysis of randomized controlled trials. Canadian Medical Association Journal. 2007 Sep 25;177(7):725-34.

No of studies	Study design	Risk of bias	Quality assessment				Other considerations	No of patients		Effect		Quality	Importance
			Inconsistency	Indirectness	Imprecision	erythropoietin-receptor agonists		placebo	Relative (95% CI)	Absolute (95% CI)			
Mortality (follow up: 21-140 days)													
9	randomized trials	not serious ¹	not serious	serious ²	not serious	none	238/1695 (14.0%)	255/1619 (15.8%)	OR 0.86 (0.71 to 1.05)	19 fewer per 1,000 (from 7 more to 40 fewer)	⊕⊕⊕○ MODERATE	CRITICAL	

CI: Confidence interval; **OR:** Odds ratio

1. Only 3 studies judged to be at low risk of bias, however, we did not downgrade for risk of bias.
2. We downgraded the quality of evidence by one level for indirectness of population, the population not representative of acutely septic patients. The 3 Corwin studies, which contribute the largest number of patients to the meta-analysis, did not enroll patients until they had been in the ICU for at least 48 h. The Silver study is indirect in that they enrolled patients in the first 7 days after transfer to a long-term acute care facility.

Table 41. Antithrombin III compared to placebo for sepsis

CI: Confidence interval; RR: Risk ratio; MD: Mean difference

1. We downgraded the quality of evidence for inconsistency by one level, the I² =42%
2. We downgraded the quality of evidence for imprecision by one level, the 95% CI embraces 1

3. Funnel plot asymmetry noted, however, we did not downgrade for publication bias because we downgraded for other categories
4. We downgraded the quality of evidence for inconsistency by one level, the $I^2 = 57\%$

MECHANICAL VENTILATION

Table 45. Low tidal versus high tidal volume ventilation in mechanically ventilated patients with sepsis

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	low tidal volume ventilation (6ml/kg)	high tidal volume ventilation (12ml/kg)	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: longest available)												
6	randomized trials	not serious ¹	not serious	not serious ²	not serious	none	233/655 (35.6%)	274/642 (42.7%)	RR 0.83 (0.72 to 0.95)	73 fewer per 1000 (from 21 fewer to 120 fewer)	⊕⊕⊕⊕ HIGH	CRITICAL
Duration of mechanical ventilation												
3	randomized trials	serious ³	not serious	not serious ²	serious ⁴	none	144	144	-	MD 0.83 days lower (1.92 lower to 0.27 higher)	⊕⊕○○ LOW	IMPORTANT

MD – mean difference, RR – relative risk

1. Intervention was not blinded in any of the trials however we did not downgrade the quality of evidence for the outcome of mortality.
2. The intervention and comparator did vary slightly from study to study and some used intervention of 8ml/kg rather than 6 or comparator of 10ml/kg rather than 12ml/kg. However, the signal seems robust and decision was made not to lower.
3. We downgraded the quality of evidence for risk of bias by one level, unblinded intervention for a subjective outcome that could be affected.
4. We downgraded the quality of evidence for imprecision by one level, wide confidence intervals do not exclude harm.

Table 46. Targeting plateau pressures in mechanically ventilated patients with sepsis

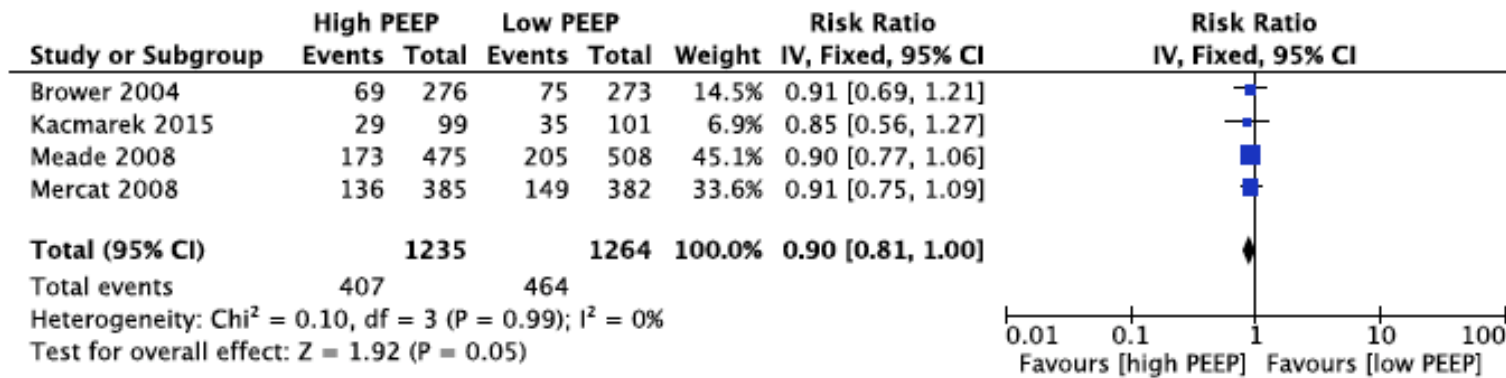

№ of studies	Study design	Risk of bias	Quality assessment				№ of patients		Effect		Quality	Importance
			Inconsistency	Indirectness	Imprecision	Other considerations	Upper limit of plateau pressure: 30 cmH2O	Plateau pressure > 30 cmH2O	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: in hospital)												
3	randomized trials	not serious	not serious	not serious	serious ¹	none	201/528 (38.1%)	245/561 (43.7%)	RR 0.83 (0.67 to 1.02)	74 fewer per 1000 (from 9 more to 144 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Barotrauma												
2	randomized trials	not serious	not serious	not serious	serious ²	none	59/512 (11.5%)	51/550 (9.3%)	RR 1.24 (0.87 to 1.77)	22 more per 1000 (from 12 fewer to 71 more)	⊕⊕⊕○ MODERATE	IMPORTANT

CI: Confidence interval; **RR:** Risk ratio

1. We downgraded the quality of evidence by one level for imprecision, the CI does not exclude harm.
2. We downgraded the quality of evidence by one level for imprecision, the Wide confidence intervals don't exclude harm or benefit.

Table 48. Recruitment maneuvers in mechanically ventilated patients with sepsis

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	recruitment maneuvers	no recruitment maneuvers	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: in-hospital)												
10	randomized trials	serious ¹	not serious	not serious	not serious	none	281/780 (36.0%)	331/793 (41.7%)	RR 0.84 (0.74 to 0.95)	67 fewer per 1000 (from 21 fewer to 109 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Oxygenation (assessed with: Severe hypoxemia requiring rescue therapy)												
5	randomized trials	serious ²	not serious	not serious	serious ³	none	49/549 (8.9%)	73/567 (12.9%)	RR 0.76 (0.41 to 1.40)	31 fewer per 1000 (from 51 more to 76 fewer)	⊕⊕○○ LOW	IMPORTANT

CI: Confidence interval; RR: Risk ratio

1. Statistically significant treatment benefit was lost when excluded the high risk of bias RCTs in sensitivity analysis.
2. High risk of bias in included studies.
3. Wide confidence intervals don't exclude harm.

Reference for Evidence Synthesis: Suzumura, E.A., Figueiró, M., Normilio-Silva, K. et al. Intensive Care Med (2014) 40: 1227. doi:10.1007/s00134-014-3413-6

Table 49. Prone ventilation compared to supine ventilation in patients with sepsis

№ of studies	Study design	Quality assessment					№ of patients		Effect		Quality	Importance
		Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	prone ventilation	no prone ventilation	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: 30-180 day mortality)												
8	randomized trials	not serious ¹	not serious	not serious	serious ²	none	377/912 (41.3%)	409/846 (48.3%)	RR 0.85 (0.71 to 1.01)	73 fewer per 1000 (from 5 more to 140 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Oxygenation (assessed with: mean change in PF ratio)												
4	randomized trials	serious ³	not serious	not serious	not serious	none	424	403	-	MD 24.03 higher (13.35 higher to 34.71 higher)	⊕⊕⊕○ MODERATE	IMPORTANT
Pressure Sores												
3	randomized trials	serious ³	not serious	not serious	serious ⁴	none	76/184 (41.3%)	54/182 (29.7%)	RR 1.37 (1.05 to 1.79)	110 more per 1000 (from 15 more to 234 more)	⊕⊕○○ LOW	IMPORTANT
Tracheal Tube Displacement												
8	randomized trials	serious ³	not serious	not serious	serious ⁵	none	117/1031 (11.3%)	103/990 (10.4%)	RR 1.09 (0.85 to 1.39)	9 more per 1000 (from 16 fewer to 41 more)	⊕⊕○○ LOW	IMPORTANT
Cardiac Arrhythmia												
3	randomized trials	serious ³	not serious	not serious	serious ⁶	none	51/334 (15.3%)	76/308 (24.7%)	RR 0.64 (0.47 to 0.87)	89 fewer per 1000 (from 32 fewer to 131 fewer)	⊕⊕○○ LOW	IMPORTANT

MD – mean difference, RR – relative risk

1. Blinding not possible for this intervention. Did not lower for objective outcome of mortality.
2. Confidence intervals do not exclude lack of benefit. If no benefit then would affect clinical decision as resources/time required to perform prone ventilation.
3. Lack of blinding for a subjective outcome may have influenced outcome.
4. Despite confidence intervals that suggest harm, the number of events was small and therefore less confident overall with precision.
5. Wide confidence intervals do not exclude harm or benefit.
6. Despite confidence intervals that suggest benefit, the number of events was small leading to less certain estimates of precision.

Reference for Evidence Synthesis: Bloomfield R, Noble DW, Sudlow A. Prone position for acute respiratory failure in adults. Cochrane Database of Systematic Reviews 2015, Issue 11. Art. No.: CD008095. DOI: 10.1002/14651858.CD008095.pub2.

Table 50. Head of bed elevation compared to no elevation in mechanically ventilated patients with sepsis

Quality assessment							№ of patients		Effect		Quality	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	HOB elevation between 30 and 45 degrees	no head of bed elevation	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: days)												
3	randomized trials	not serious	not serious	serious ¹	serious ²	none	45/168 (26.8%)	50/169 (29.6%)	RR 0.90 (0.64 to 1.27)	30 fewer per 1000 (from 80 more to 107 fewer)	⊕⊕○○ LOW	CRITICAL
VAP (assessed with: various scoring systems)												
3	randomized trials	serious ³	serious ⁴	serious ^{1,5}	very serious ⁶	none	19/168 (11.3%)	24/169 (14.2%)	RR 0.67 (0.23 to 2.01)	47 fewer per 1000 (from 109 fewer to 143 more)	⊕○○○ VERY LOW	CRITICAL

CI: Confidence interval; **RR:** Risk ratio; **VAP:** Ventilator associated pneumonia; **HOB:** Head of bed

1. One trial (Drakulovic, n=86) compared 45 degrees vs 0, one trial (Keeley, n=30) compared 45 degrees vs 25, one trial (van Niewenhoven, n=221) compared 45 degrees to 10.
2. Wide confidence intervals do not exclude harm.
3. Lack of blinding and a subjective outcome.
4. High Isquared value (66%).
5. Various definitions of VAP used in individual studies.
6. Wide confidence intervals and small number of events.

Table 51. The use of weaning protocol compared to no protocol in mechanically ventilated patients with sepsis

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	weaning protocol	no protocol	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: ICU Mortality)												
7	randomized trials	not serious	not serious	not serious	serious ¹	none	249/1119 (22.3%)	247/1115 (22.2%)	OR 0.93 (0.58 to 1.48)	12 fewer per 1000 (from 75 more to 80 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Successful Extubation (assessed with: Reintubation rate)												
11	randomized trials	not serious	not serious	not serious	serious ²	none	70/747 (9.4%)	88/740 (11.9%)	OR 0.74 (0.44 to 1.23)	28 fewer per 1000 (from 23 more to 63 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Duration of Mechanical Ventilation (assessed with: days)												
14	randomized trials	not serious ³	serious ⁴	not serious	not serious	none	1107	1098	-	MD 0.3 days fewer (0.46 fewer to 0.14 fewer)	⊕⊕⊕○ MODERATE	CRITICAL

CI: Confidence interval; **OR:** Odds ratio; **MD:** Mean difference

1. Wide confidence intervals do not exclude harm or benefit.
2. Wide confidence intervals do not exclude harm with weaning protocol.
3. Sensitivity analysis excluding high risk of bias studies showed no difference.
4. We downgraded the quality of evidence by one level for inconsistency, $I^2 = 70\%$.

Reference for Evidence Synthesis: Blackwood B, Burns KEA, Cardwell CR, O'Halloran P. Protocolized versus non-protocolized weaning for reducing the duration of mechanical ventilation in critically ill adult patients. Cochrane Database of Systematic Reviews 2014, Issue 11. Art. No.: CD006904. DOI: 10.1002/14651858.CD006904.pub3.

Table 52. The use of SBTs compared to no SBTs in mechanically ventilated patients with sepsis

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	SBTs	no SBTs	Relative (95% CI)	Absolute (95% CI)		
Duration of Mechanical Ventilation (assessed with: days)												
8	randomized trials	not serious	not serious	not serious	not serious ¹	none	600	588	-	MD 0.18 days fewer (0.36 fewer to 0)	⊕⊕⊕⊕ HIGH	CRITICAL
Weaning Duration (assessed with: log hours)												
2	randomized trials	not serious	not serious	not serious	not serious	none	167	169	-	MD 3.23 log hours fewer (3.57 fewer to 2.89 fewer)	⊕⊕⊕⊕ HIGH	IMPORTANT

CI: Confidence interval; **MD:** Mean difference; **SBT:** Spontaneous breathing trial

1. Confidence intervals do not rule out no effect of SBT however even if no effect would probably still perform SBT because of the positive impact on other critical outcomes.

Reference for Evidence Synthesis: Blackwood B, Burns KEA, Cardwell CR, O'Halloran P. Protocolized versus non-protocolized weaning for reducing the duration of mechanical ventilation in critically ill adult patients. Cochrane Database of Systematic Reviews 2014, Issue 11. Art. No.: CD006904. DOI: 10.1002/14651858.CD006904.pub3.

Table 53. The use of PAC compared to no PAC in mechanically ventilated patients with sepsis

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	PACs	no PACs	Relative (95% CI)	Absolute (95% CI)		
Mortality (assessed with: varying duration)												
5 ¹	randomized trials	not serious	not serious	not serious	not serious	none	741/1466 (50.5%)	728/1457 (50.0%)	RR 1.02 (0.96 to 1.09)	10 more per 1000 (from 20 fewer to 45 more)	⊕⊕⊕⊕ HIGH	CRITICAL
ICU length of stay (assessed with: days)												
4 ¹	randomized trials	not serious	not serious	not serious	not serious	none	1370	1353	-	MD 0.15 days higher (0.74 lower to 1.03 higher)	⊕⊕⊕⊕ HIGH	CRITICAL

CI: Confidence interval; **RR:** Risk ratio; **MD:** Mean difference; **PAC:** Pulmonary artery catheter

1. Only included general ICU patient subgroup from Cochrane review (not perioperative patients).

Reference for Evidence Synthesis: Rajaram SS, Desai NK, Kalra A, Gajera M, Cavanaugh SK, Brampton W, Young D, Harvey S, Rowan K. Pulmonary artery catheters for adult patients in intensive care. MD – mean difference, RR – relative risk

1. Intervention was not blinded in most studies however not lowered for ROB for objective outcome of mortality.
2. Studies were performed in a wide variety of patients. Only one study (68%) of the total weight was done in ICU patients. All other studies were done in the postoperative setting although some of these were in CV Surgery and ended up as ICU patients. Importantly the point estimate did not vary much between the operative and ICU subgroups.
3. Wide confidence intervals that do not exclude significant harm or benefit.
4. Intervention was not blinded in most studies.
5. High degree of statistical heterogeneity with $I^2 > 75\%$.
6. Despite tight confidence intervals that exclude harm, event numbers are small leading to imprecision

Duration of Mechanical Ventilation												
3	randomized trials	serious ⁴	not serious	not serious ³	serious ⁶	none	223	208	-	MD 1.21 fewer (4.23 fewer to 1.81 more)	⊕○○○ LOW	IMPORTANT

CI: Confidence interval; RR: Risk ratio; MD: Mean difference; NMBA: Neuromuscular blocking agents

1. Lack of blinding in most included trials and no assessment of publication bias given the small number of trials included.
2. $I^2 = 0\%$ and results were robust in sensitivity analysis.
3. Although included studies looked at all patients with ARDS we have no reason to believe they will behave differently than those with sepsis-induced ARDS. Subgroup analysis was done for sepsis-induced ARDS for mortality outcome and there was no difference between those with sepsis ARDS and all-comers with ARDS.
4. incomplete blinding in included trials
5. rated down 2 levels for incomplete blinding & ascertainment bias (limited assessment in 2 of the included trials)
6. wide confidence intervals which do not include no effect

METABOLIC SECTION

Table 59. Stress ulcer prophylaxis compared to no prophylaxis in critically ill patients

Author(s): Alhazzani W

Date: September 27 2015

Question: Stress ulcer prophylaxis compared to no prophylaxis in critically ill patients

Setting: ICU

Bibliography: Krag M, Perner A, Wetterslev J, Wise MP, Hylander Moller M: Stress ulcer prophylaxis versus placebo or no prophylaxis in critically ill patients. A systematic review of randomized clinical trials with meta-analysis and trial sequential analysis. Intensive care medicine 2014, 40:11-22.

7	randomized trials	serious ¹	not serious	not serious	serious ⁵	none	64/510 (12.5%)	56/498 (11.2%)	RR 1.23 (0.86 to 1.78)	26 more per 1000 (from 16 fewer to 88 more)	⊕⊕○○ LOW ¹⁵	CRITICAL

MD – mean difference, RR – relative risk

1. We downgraded by one level for risk of bias, majority of studies were unblinded.
2. Although $I^2 = 48\%$, we considered this as mild heterogeneity and we did not downgrade the quality of evidence
3. We downgraded by one level, due to small number of events (number of events 228)
4. We downgraded by one level, the confidence interval contained significant benefit and harm (95% CI 0.84, 1.20)
5. We downgraded by one level, the confidence interval contained significant benefit and harm (95 % CI 0.86–1.78)

Table 60. Evidence Profile for proton pump inhibitors versus histamine-2 receptor antagonists.

Author(s): Alhazzani W

Date: November 27 2015

Question: Proton pump inhibitors compared to histamine-2-antagonists for stress ulcer prophylaxis

Setting: ICU

Bibliography: Alshamsi et al 2016 (not published); MaClaren 2014

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	proton pump inhibitors	histamine-2-antagonists	Relative (95% CI)	Absolute (95% CI)		
Clinically important Bleeding

Clostridium difficile												
1	Observational studies	Not serious	Not serious	Not serious	Serious ⁶	none	300/8799 (3.4%)	227/8799 (2.6%)	OR 1.28 (1.02 to 1.61)	7 more per 1000 (from 1 more to 15 more)	 VERY LOW	CRITICAL
ICU length of stay												

7	randomized trials	serious ²	not serious	not serious	serious ³	none	371	373	-	MD 0.58 days fewer (2.03 fewer to 0.86 more)	 LOW ^{2,3}	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	-----	-----	---	---	---	----------

MD – mean difference, RR – relative risk

1. We downgraded by one level, for risk of bias, most studies were un-blinded.
2. Although the total number of events was small, we did not downgrade for imprecision.
3. We did not downgrade for risk of bias because mortality is an objective outcome that is less likely to be affected by lack of blinding in clinical trials.
4. We downgraded by one level for imprecision, the confidence interval contains significant benefit and harm.
5. Significant inconsistency was not present ($I^2=4\%$)
6. We downgraded by one level for imprecision, the confidence interval contains small and large harm.
7. We downgraded by one level for risk of bias
8. We downgraded by one level for imprecision, the confidence interval contained significant benefit and harm (95% CI 0.88, 1.53).

Table 61. Pharmacologic anticoagulation compared to No anticoagulation for VTE prevention

Question: Pharmacologic anticoagulation compared to No anticoagulation for VTE prevention

Setting: ICU

Bibliography: Alhazzani W et al. Crit Care Med 2013; 41:2088-2098

Quality assessment							No of patients		Effect		Quality	Importance

								5.0%		7 fewer per 1000 (from 13 more to 21 fewer)		
Pulmonary Embolism												
3	randomized trials	not serious	not serious	not serious ³	serious ⁶	none ⁴	15/1461 (1.0%)	28/1434 (2.0%)	RR 0.53 (0.28 to 0.98)	9 fewer per 1000 (from 0 fewer to 14 fewer)	⊕⊕⊕○ MODERATE	CRITICAL
Major Bleeding												

2	randomized trials	serious ⁷	serious ⁸	not serious	very serious ⁹	none ⁴	44/1084 (4.1%)	53/1072 (4.9%)	RR 0.81 (0.55 to 1.21)	9 fewer per 1000 (from 10 more to 22 fewer)	⊕○○○ VERY LOW	CRITICAL
Mortality												
2	randomized trials	not serious	not serious	not serious	serious ¹⁰	none ⁴	283/1080 (26.2%)	313/1068 (29.3%)	RR 0.89 (0.78 to 1.02)	32 fewer per 1000 (from 6 more to 64 fewer)	⊕⊕○○ MODERATE	CRITICAL
							25.0%	27 fewer per 1000 (from 5 more to 55 fewer)				

CI: Confidence interval; RR: Risk ratio

1. Two trials were at low risk of bias [Shorr et al., Cade et al.], one trial was at high risk of bias due to incomplete outcome assessment [Fraisie et al.], after excluding this trial there was a residual benefit from the intervention for this outcome
2. We downgraded by one level for inconsistency, unexplained heterogeneity was present $I^2= 77\%$
3. Although studies included mixed ICU population, we did not consider this as a significant indirectness, therefore, we did not downgrade for indirectness
4. We could not reliably assess for publication bias due to small number
5. The CI interval is wide, it includes significant benefit and harm, therefore, we downgraded by two levels for serious imprecision
6. We downgraded by one level for imprecision, the number of event is small and the confidence interval included non-significant benefit
7. We downgraded by one level for risk of bias
8. We downgraded by one level for serious inconsistency, $I^2= 50\%$
9. We downgraded by two levels for serious imprecision, the CI contained significant benefit and harm
10. We downgraded by one level for imprecision, the CI contained significant benefit and small harm

Table 62. LMWH compared to UFH for VTE prevention

16	not serious	not serious	serious ¹	serious ²	none	145/616 (23.5%)	157/600 (26.2%)	RR 0.86 (0.71 to 1.03)	37 fewer per 1,000 (from 8 more to 76 fewer)	⊕⊕○○ LOW
ICU length of stay										
11	serious ³	serious ⁴	serious ¹	not serious	none	456	446	-	MD 3.84 days fewer (5.57 fewer to 2.12 fewer)	⊕○○○ VERY LOW
Duration of mechanical ventilation										
6	serious ³	serious ⁵	serious ¹	not serious	none	241	231	-	MD 2.33 days fewer (4.44 fewer to 0.22 fewer)	⊕○○○ VERY LOW

1. We rated down the quality of evidence by one level for multiple sources of indirectness. Population: mechanical ventilation and sepsis severity varied as inclusion criteria across studies. Intervention: content of enteral/parenteral formulations differed across studies (9 used omega-3 alone while 7 used formulae with additional supplements such as omega-6, antioxidants, mRNA, arginine, and selenium). Outcome: different mortality definitions (28-day, 60-day, in-hospital, ICU).
2. We rated down the quality of evidence by one level for imprecision. The CI included both significant benefit and harm.
3. We rated down the quality of evidence by one level for risk of bias. Several studies showed high risk of attrition bias and performance bias.
4. We rated down the quality of evidence by one level for significant unexplained heterogeneity ($P < 0.00001$, $I^2 = 84\%$).
5. We rated down the quality of evidence by one level for significant unexplained heterogeneity ($P = 0.010$, $I^2 = 67\%$).

Table 70. Not measuring gastric residual volume (GRV) compared to measuring GRV in enterally fed septic patients

Author(s): Alhazzani W, McIntyre L

Date: January 8, 2016

Question: Not measuring GRV compared to measuring GRV in enterally fed septic patients

Setting: ICU

Bibliography: Reignier, J., Mercier, E., Le Gouge, A., Boulain, T., Desachy, A., Bellec, F., ... & Lascarrou, J. B. (2013). Effect of not monitoring residual gastric volume on risk of ventilator-associated pneumonia in adults receiving mechanical ventilation and early enteral feeding: a randomized controlled trial. *JAMA*, 309(3), 249-256.

CI: Confidence interval; RR: Risk ratio; GRV: Gastric residual volume

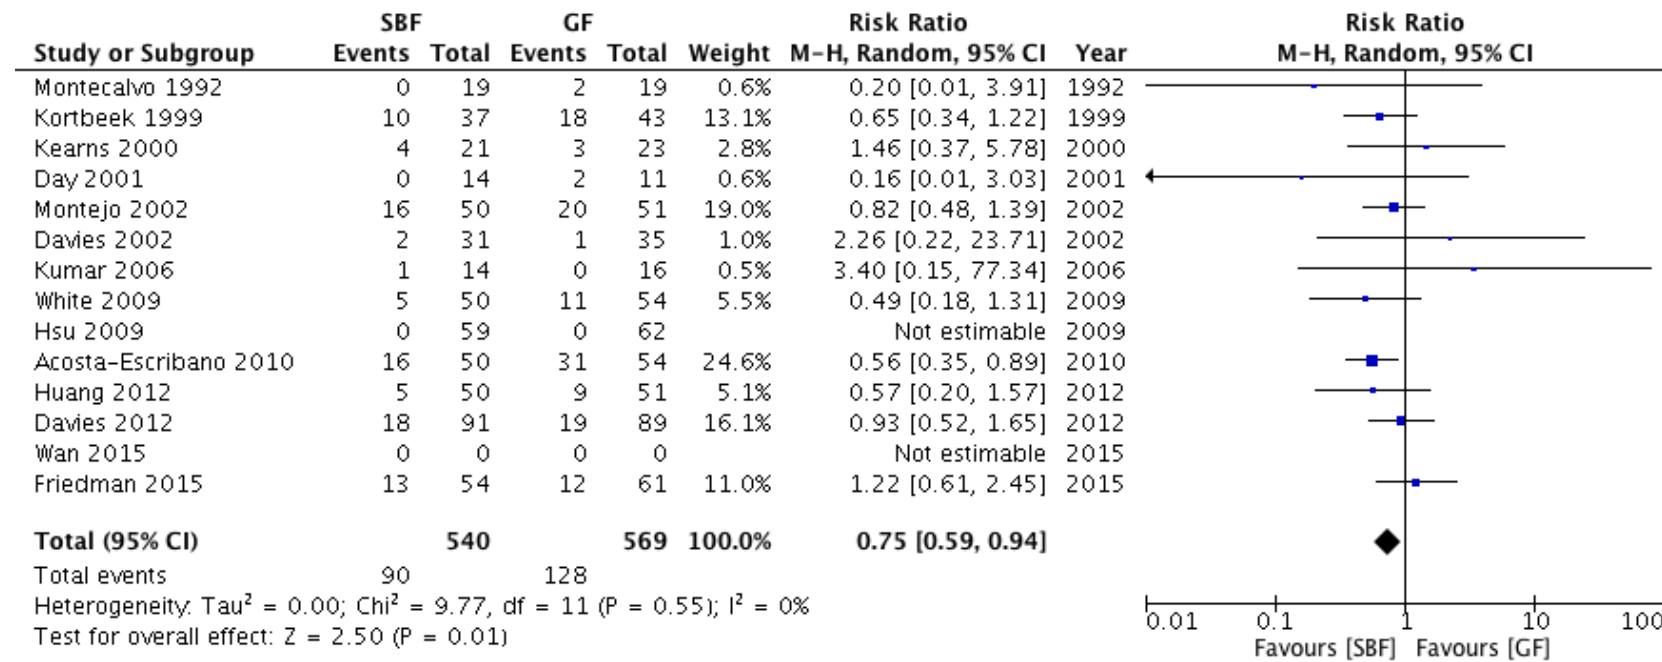

1. This study included critically ill patient population (12%) were septic patients, we did not consider this as a significant indirectness.
2. We downgraded the quality of evidence for imprecision, the CI included significant benefit and harm
3. We downgraded the quality of evidence for imprecision, the CI included significant benefit and harm
4. We downgraded the quality of evidence for imprecision, the CI included small benefit that was lower than the clinical decision threshold

MD – mean difference, RR – relative risk

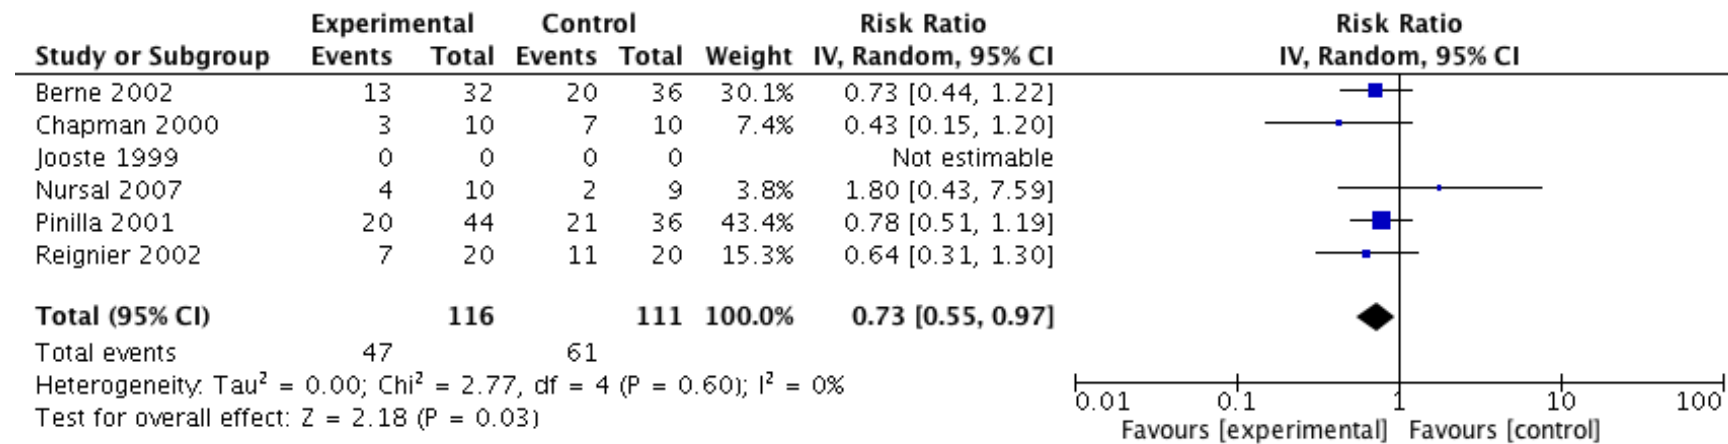

1. We downgraded the quality of evidence by one level for risk of bias, most RCTs were unblinded and pneumonia definition varied between studies
2. We downgraded the quality of evidence by one level for imprecision, the CI included small benefit
3. We used a control group event rate of 10%
4. We downgraded the quality of evidence by one level for imprecision, the CI contained both significant benefit and harm
5. We downgraded the quality of evidence by one level for risk of bias, this is because of poor outcome definition and risk of ascertainment bias
6. We downgraded the quality of evidence by one level for imprecision, the CI contained significant benefit and harm
7. Although the $I^2=48\%$, we did not downgrade for inconsistency, because we considered this as minimal heterogeneity
8. We downgraded the quality of evidence by one level for imprecision, the CI contained significant benefit and harm

ICU length of stay												
3	randomized trials	serious ⁵	not serious	not serious	serious ⁸	none	668	681	-	MD 0.12 days lower (1.42 lower to 1.17 higher)	⊕⊕○○ LOW	IMPORTANT

MD – mean difference, RR – relative risk

1. We downgraded the quality of evidence by one level for risk of bias, three studies were at high risk of bias, mainly due to lack of blinding (detection and performance biases) and incomplete outcome data (attrition bias), and four studies were classified as unclear risk of bias.
2. We downgraded the quality of evidence by one level for imprecision, the results were sensitive to the metric used to summarize the results, if RR is used the UL of CI reaches 1, therefore we decided to lower the quality of evidence
3. estimates of mortality from sepsis is approximately 20% (Kaukonen KM, Bailey M, Suzuki S, Pilcher D, Bellomo R. Mortality related to severe sepsis and septic shock among critically ill patients in Australia and New Zealand, 2000-2012. JAMA. 2014;311(13):1308-16.)
4. We downgraded the quality of evidence for imprecision by one level, the CI contained small benefit but significant harm (45% relative risk increase in mortality)
5. We downgraded the quality of evidence for risk of bias by one level.
6. Although $I^2 = 50\%$ we did not downgrade for imprecision, because we downgraded for other categories
7. We downgraded the quality of evidence by two levels for imprecision, the CI was very wide including substantial benefit and harm
8. We downgraded the quality of evidence for imprecision by one level

Table 74. Glutamine compared to No Glutamine in sepsis or septic shock

Author(s): Jones A, Alhazzani W

Date: December 3 2015

Question: Glutamine compared to No Glutamine in sepsis or septic shock

Setting: ICU

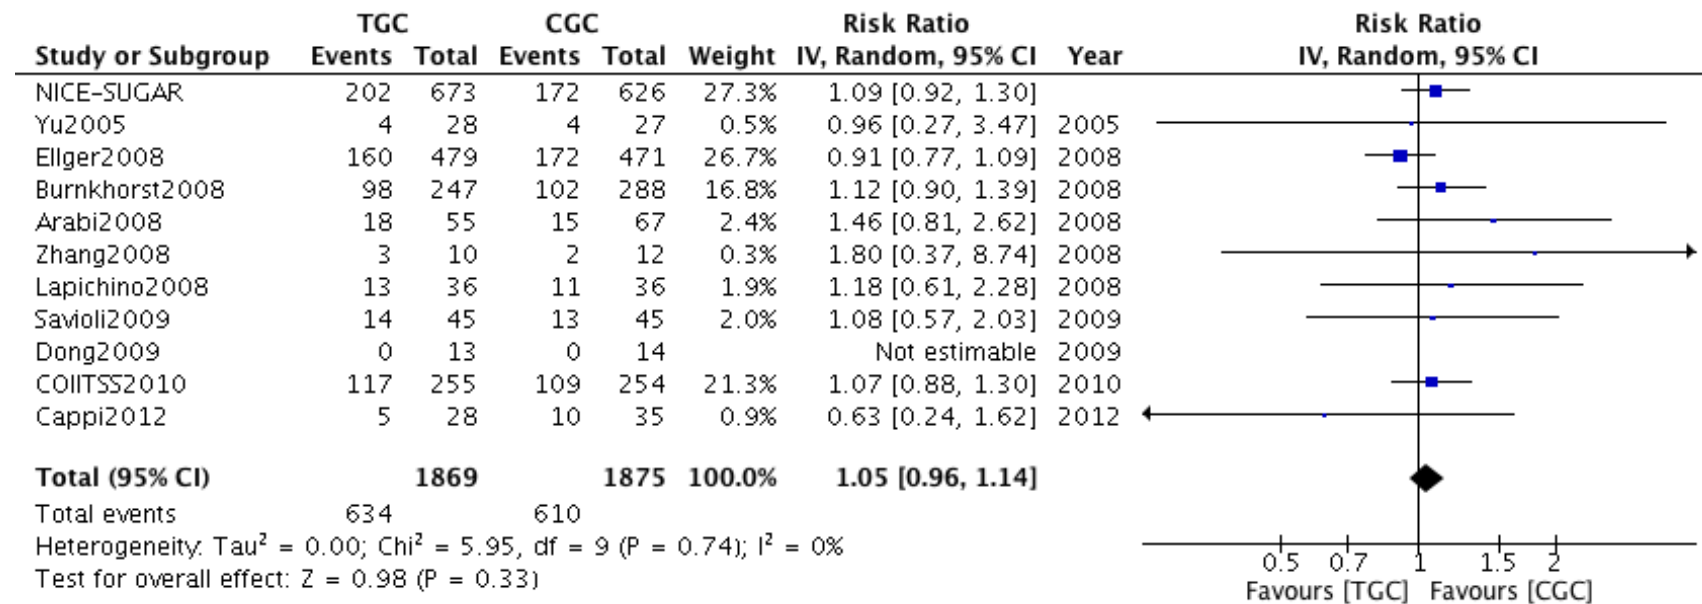

Bibliography: Tao KM, Li XQ, Yang LQ, Yu WF, Lu ZJ, Sun YM, Wu FX. Glutamine supplementation for critically ill adults. Cochrane Database of Systematic Reviews 2014, Issue 9. Art. No.: CD010050. DOI: 10.1002/14651858.CD010050.pub2

Quality assessment							No of patients		Effect		Quality	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Glutamine	No Glutamine	Relative (95% CI)	Absolute (95% CI)		
Mortality (long term) (follow up: 6 months)												
11	randomized trials	not serious	not serious ¹	serious ²	not serious	none	373/1140 (32.7%)	373/1137 (32.8%)	RR 1.00 (0.89 to 1.12)	0 fewer per 1000 (from 36 fewer to 39 more)	⊕⊕⊕○ MODERATE	CRITICAL

MD – mean difference, RR – relative risk

1. $I^2=30\%$, we did not downgrade for inconsistency
2. We downgraded the quality of evidence for indirectness by one level, all RCTs looked at critically ill population and were not focused on septic population

Figure 65. Tight glucose control versus conventional control in patients with sepsis: Mortality Outcome

TGC: Tight glucose control; CGC: Conventional glucose control; IV: Inverse variance

Table 75. Tight glucose control (TGC) compared to Conventional glucose control (CGC) in patients with sepsis or septic shock

Author(s): Alhazzani W, Sprung C, Nishida O

Date: January 8, 2016

Question: Tight glucose control (TGC) compared to Conventional glucose control (CGC) in patients with sepsis or septic shock

Setting: Intensive Care Unit (ICU)

Bibliography: Song F, Zhong LJ, Han L, Xie GH, Xiao C, Zhao B et al. Intensive insulin therapy for septic patients: a meta-analysis of randomized controlled trials. *Biomed Res Int.* 2014;2014:698265. doi:10.1155/2014/698265.

№ of studies	Study design	Risk of bias	Quality assessment				№ of patients		Relative (95% CI)	Effect		Quality	Importance
			Inconsistency	Indirectness	Imprecision	Other considerations	tight glucose control (TGC)	Conventional glucose control (CGC)		Absolute (95% CI)			
Mortality													
11	randomized trials ¹	not serious ²	not serious	not serious	not serious	none	634/1869 (33.9%)	610/1875 (32.5%)	RR 1.05 (0.96 to 1.14)	16 more per 1000 (from 13 fewer to 46 more)	⊕⊕⊕⊕ HIGH	CRITICAL	
							25.0%	13 more per 1000 (from 10 fewer to 35 more)					
Hypoglycemia													
7	randomized trials	not serious	serious ³	not serious	not serious	strong association ⁴	196/1093 (17.9%)	55/1120 (4.9%)	RR 2.93 (1.69 to 5.06)	95 more per 1000 (from 34 more to 199 more)	⊕⊕⊕⊕ HIGH	CRITICAL	

CI: Confidence interval; **RR:** Risk ratio

1. We excluded one trial that was published as an abstract (Jin et al) in which pertinent information was not available
2. Although all RCTs were unblinded, the impact on mortality outcome is unlikely to be important, therefore, we did not lower the quality of evidence for risk of bias
3. We lowered the quality of evidence by one level for heterogeneity, the I² = 61%, this was not explained by subgroup analyses for risk of bias or blood glucose level target
4. The RR > 2, therefore, we upgraded the quality of evidence by one level

Table 76. Arterial glucose level compared to capillary glucose level for glucose monitoring in patients with sepsis or septic shock on insulin infusion

Author(s): Alhazzani W, Nishida O

Date: April 17, 2016

Question: Arterial glucose level compared to capillary glucose level for glucose monitoring in patients with sepsis or septic shock on insulin infusion

Setting: ICU

Bibliography: Inoue S, Egi M, Kotani J, Morita K. Accuracy of blood glucose measurements using glucose meters and arterial blood gas analyzers in critically ill adult patients: systematic review. Crit Care. 2013 Mar 18;17:R48. doi: 10.1186/cc12567.

№ of studies	Study design	Quality assessment					Other considerations	№ of patients		Effect		Quality	Importance
		Risk of bias	Inconsistency	Indirectness	Imprecision	arterial glucose level		capillary glucose level	Relative (95% CI)	Absolute (95% CI)			
accuracy of glucose measurement (assessed with: proportion of wrong glucose readings)													
6	observational studies	serious ¹	not serious ²	not serious	not serious	strong association ^{3,4}	79/2647 (3.0%)	204/2501 (8.2%)	RR 0.36 (0.25 to 0.52)	52 fewer per 1,000 (from 39 fewer to 61 fewer)	⊕⊕○○ LOW	IMPORTANT	

CI: Confidence interval; **RR:** Risk ratio

1. We downgraded the quality of evidence for risk of bias, as the studies were diagnostic accuracy but did not measure accuracy outcomes appropriately
2. $I^2 = 29\%$
3. We upgraded the quality of evidence by one level for large effect $RR < 0.5$
4. Dose-response gradient is not applicable, therefore, not assessed

Bloos F, et al. Effect of a multifaceted educational intervention for anti-infectious measures on sepsis mortality: a cluster randomized trial. Intensive Care Med 2017;43:1602–1612.

Quality assessed with: Higgins JPT, Green S (eds). Cochrane Handbook for Systematic Reviews of Interventions Version 5.1.0 [updated March 2011]. The Cochrane Collaboration, 2011. Available from www.handbook.cochrane.org

Study Characteristics	
Methods	A prospective multicenter cluster-randomized trial from July 2011 to July 2013 in 40 German hospitals; hospitals were randomly allocated to receive conventional continuous medical education (CME) measures (control group) or multifaceted interventions including local quality improvement teams, educational outreach, audit, feedback, and reminders
Participants	4183 patients with severe sepsis or septic shock in an intention-to-treat analysis comparing the multifaceted intervention (n=2596) with conventional CME (n=1587)
Interventions	Control group: standard lectures about sepsis care twice a year and regular newsletters with current sepsis-related publications or conference proceedings; intervention group: multifaceted implementation strategy in addition to the measures of the control group, training included primary sepsis care with focus on timing and strategy of empiric anti-infectious management, the strategy consisted of formation of interprofessional local quality improvement teams (ICU and non-ICU members), educational outreach, audit, and feedback as well as passive and active reminders
Outcomes	Primary outcome was 28-day mortality

Risk of bias		
Random sequence generation (selection bias)	Low	To minimize the risk of randomization failure, the clusters were stratified according to time to antimicrobial therapy observed in the pre-study and then randomized 1:1 to either a control group or an intervention group
Allocation concealment (selection bias)	Low	Randomization was computer generated
Blinding of participants and personnel (performance bias)	High	Blinding was not possible
Blinding of outcome assessment (detection bias)	High	Study interventions were solely performed on hospital level
Incomplete	Low	Loss of follow-up 3.1% in intervention and 4.7% in control

outcome data (attrition bias)		
Selective reporting (reporting bias) or other bias	Low	

Seymour CW, et al. Time to Treatment and Mortality during Mandated Emergency Care for Sepsis. N Engl J Med. 2017;376(23):2235-2244.

Quality assessed with Newcastle-Ottawa scale: Deeks JJ, Dinnes J, D'Amico R, et al. Evaluating non-randomised intervention studies. Health Technol Assess 2003;7:27.

Selection	
Is the case definition adequate?	Yes
Representativeness of the exposed cohort	Representative
Selection of non-exposed	Drawn from the same community as the exposed cohort
Demonstration that outcome of interest was not present at start of study	Yes
Comparability	
Comparability of cases and controls on the basis of the design or analysis	Sepsis with 3-hour bundle
Ascertainment of exposure	Secure record
Comparability of cohorts on the basis of the design or analysis	Study controls for time to completion of 3-hour bundle
Outcome	
Assessment of outcome	Record linkage
Was follow-up long enough for outcomes to occur	Yes
Adequacy of follow-up of cohorts	Complete follow-up

Question: Colloids vs. Crystalloids for fluid resuscitation in critically ill patients

Bibliography: Perel, et al. Colloids vs. Crystalloids for fluid resuscitation in critically ill patients. Cochrane Database Syst Rev 2013; (2): CD000567.

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	[intervention]	[comparison]	Relative (95% CI)	Absolute (95% CI)		
Mortality (Modified gelatin)												
11	randomised trials	serious ¹	not serious	not serious	serious ²	none	13/224 (5.8%)	15/224 (6.6%)	RR 0.91 (0.49 to 1.72)	61 fewer per 1,000 (from 348 fewer to 491 more)	 LOW	CRITICAL
Mortality (albumin or plasma protein fraction)												
24	randomised trials	serious ²	not serious	not serious	serious ²	none	922/4951 (18.6%)	914/4969 (18.4%)	RR 1.01 (0.91 to 1.10)	2 more per 1,000 (from 17 fewer to 18 more)	 LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. design of studies was not well reported; this is reflected in the number of unclear scores given for allocation concealment; blinding was not well reported and loss to follow-up was generally small

2. CI crosses decision-making threshold

Author(s): NG

Question: Colloid solutions for fluid resuscitation

Bibliography: Bunn, et al. Cochrane Database Syst Rev 2012; (7): CD001319.

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	[intervention]	[comparison]	Relative (95% CI)	Absolute (95% CI)		
Mortality (albumin/plasma protein fraction vs. gelatin)												
9	randomised trials	serious ¹	not serious	serious ²	serious ³	none	Total 824 (no event rates in both groups reported in the meta-analysis)		RR 0.89 (0.65 to 1.21)		⊕○○○ VERY LOW	CRITICAL
Mortality (HES vs. gelatin)												
25	randomised trials	serious ¹	not serious	not serious	serious ³	none	Total 1756 (no event rates in both groups reported in the meta-analysis)		RR 1.03 (0.84 to 1.26)		⊕⊕○○ LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. unclear allocation concealment and blinding
2. Nine trials (824 participants) reported mortality but only three of those trials had any deaths. The RR was 0.89 (95% CI 0.65 to 1.21). The Boldt trial included in this analysis had no events
3. cross of decision-making threshold

Author(s): NG

Question: Colloid solutions for fluid resuscitation in patients with sepsis

Bibliography: Zhong, et al. J Emerg Med. 2013;45(4):485-95.

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	[intervention]	[comparison]	Relative (95% CI)	Absolute (95% CI)		
Mortality (albumin vs. HES)												
10	randomised trials	not serious	not serious	serious ¹	serious ²	none	61/212 (28.8%)	54/201 (26.9%)	RR 0.98 (0.74 to 1.30)	5 fewer per 1.000 (from 70 fewer to 81 more)	 LOW	CRITICAL
Mortality (gelatin vs. albumin)												
2	randomised trials	not serious	serious ³	serious ⁴	serious ²	none	9/50 (18.0%)	3/50 (6.0%)	RR 2.40 (0.31 to 18.35)	84 more per 1.000 (from 41 fewer to 1.000 more)	 VERY LOW	CRITICAL
Mortality (gelatin vs. HES)												
4	randomised trials	not serious	not serious	serious ¹	serious ²	none	53/102 (52.0%)	53/103 (51.5%)	RR 1.02 (0.79 to 1.32)	10 more per 1.000 (from 108 fewer to 165 more)	 LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. trials and event rates are very small
2. cross of decision-making threshold
3. I² = 59% (technically, though meta-analysis of 2 trials are questionable on the analytical level)
4. small event rates

Author(s): NG

Question: Gelatin solution as a plasma expander for perioperative and critically ill patients

Bibliography: Saw, et al. Anaesth Intensive Care 2012; 40: 17-32.

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	[intervention]	[comparison]	Relative (95% CI)	Absolute (95% CI)		
Mortality (all-cause hospital or 28 day)

Question: Balanced crystalloids compared to saline in critically and noncritically ill patients

Bibliography: Rochwerg, et al. Fluid resuscitation in sepsis: a systematic review and network meta-analysis. Ann Intern Med. 2014;161(5):347-55; Semler, et al. Balanced crystalloids versus saline in critically ill adults. N Engl J Med 2018; 378: 829-839; Self, et al. Balanced crystalloids versus saline in noncritically ill adults. N Engl J Med 2018; 378:819-828.

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	[intervention]	[comparison]	Relative (95% CI)	Absolute (95% CI)		
Mortality (in-hospital)												
2 ¹	randomised trials	not serious	not serious	serious ²	serious ³	none	913/14650 (6.2%) ⁴	980/14499 (6.8%)	OR 0.89 (0.70 to 1.04)	7 fewer per 1.000 (from 3 more to 19 fewer)	 LOW	CRITICAL
Major adverse kidney event												
2 ¹	randomised trials	not serious	not serious	serious ²	not serious	none	1454/14650 (9.9%) ⁴	1581/14499 (10.9%)	OR 0.85 (0.74 to 0.98)	15 fewer per 1.000 (from 2 fewer to 26 fewer)	 MODERATE	CRITICAL

CI: Confidence interval; OR: Odds ratio

1. plus results from indirect comparisons, see Rochwerg, et al.
2. due to evidence from indirect analyses and from two trials with different cohorts (critically vs. noncritically ill) and only 14% sepsis population
3. CI crosses decision making threshold
4. event and total number were taken from the two randomised trials, event rates significantly differ in mortality due to trial design

Question: Is Omega-3 Fatty Acids Enriched Nutrition Support Safe for Critical Ill Patients? compared to [comparison] for [health problem and/or population]

Setting: Critically ill

Bibliography: Chen W, et al. Is Omega-3 Fatty Acids Enriched Nutrition Support Safe for Critical Ill Patients? A Systematic Review and Meta-Analysis. Nutrients 2014;6:2148-2164.

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Omega-3 Fatty Acids	Control	Relative (95% CI)	Absolute (95% CI)		
Overall mortality												
12	randomised trials	not serious	serious ¹	not serious	serious ²	none	136/609 (22.3%)	160/609 (26.3%)	RR 0.82 (0.62 to 1.09) ³	47 fewer per 1,000 (from 24 more to 100 fewer)	 LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

1. I²=42%

2. Cross of decision making threshold

3. After excluding Rice, T. et al. from EN-fed omega-3 meta-analysis, no significant heterogeneity between remaining trials (I²=17%); fixed model on 566 patients then indicated that omega-3 fatty acids enriched enteral nutrition could significantly reduce mortality (RR, 0.69; 95% CI 0.53 to 0.91)
